Abstract—The present paper is the investigation of certain properties of generalized Bessel-Maitland function, written in the form $J_{\nu,q}^{\mu,\gamma}(z) = \sum_{n=0}^{\infty} \frac{(\gamma)_{qn}(-z)^n}{n! \Gamma(\mu n + \nu + 1)}$, where $\mu, \nu, \gamma \in \mathbb{C}; \operatorname{Re}(\mu) \geq 0, \operatorname{Re}(\nu) \geq -1, \operatorname{Re}(\gamma) \geq 0$ and $q \in (0,1) \cup \mathbb{N}$. For the function $J_{\nu,q}^{\mu,\gamma}(z)$, a number of results including differentiation and integration formulas, Mellin-Barnes integral representation, Laplace transform, Euler transform, k -transform, Varma transform, Mellin transform. Various relationship with other functions including Fox's H -function and Wright hypergeometric function were also established. In the end certain relations have been obtained by using the Riemann-Liouville fractional integrals and derivatives.

Mathematics Subject Classification(2010)—Primary 42C05, Secondary 33C45.

Keywords—Generalized Bessel-Maitland function, integral transform, Wright hypergeometric function, Fox's H -function, generalized hypergeometric function, fractional calculus.

I. INTRODUCTION

The special function of the form defined by the series representation

$$\begin{aligned} J_{\nu}^{\mu}(z) &= \sum_{n=0}^{\infty} \frac{(-z)^n}{n! \Gamma(\mu n + \nu + 1)} \\ &= \phi(\mu, \nu + 1; -z) \\ &= H_{0,2}^{1,0} \left[z \mid \begin{matrix} - \\ (0,1), (-\nu, \mu); \end{matrix} \right] \end{aligned} \quad (1.1)$$

is known as Bessel-Maitland function, or the Wright generalized function ([15], (8.3)). It has a wide application in the problem of physics, chemistry, biology, engineering and applied sciences. The theory of Bessel functions is intimately connected with the theory of certain types of differential equations. A detailed account of application of Bessel function is

represented in the book of Watson [12].

In this paper, a generalization of Bessel-Maitland function is investigated and is defined as

$$J_{\nu,q}^{\mu,\gamma}(z) = \sum_{n=0}^{\infty} \frac{(\gamma)_{qn}(-z)^n}{n! \Gamma(\mu n + \nu + 1)} \quad (1.2)$$

where, $\mu, \nu, \gamma \in \mathbb{C}; \operatorname{Re}(\mu) \geq 0, \operatorname{Re}(\nu) \geq -1, \operatorname{Re}(\gamma) \geq 0$ and $q \in (0,1) \cup \mathbb{N}$ and $(\gamma)_0 = 1, (\gamma)_{qn} = \frac{\Gamma(\gamma + qn)}{\Gamma(\gamma)}$, denotes the generalized pochhammer symbol (see Rainville, [8]), which in particular reduces to $q^{qn} \prod_{j=1}^q \left(\frac{\gamma + j - 1}{q} \right)_n$ if $q \in \mathbb{N}$.

Some important special cases of this function are enumerated below:

- (i) $J_{\nu,0}^{\mu,\gamma}(z) = J_{\nu}^{\mu}(z)$, defined by (1.1).
- (ii) $J_{\nu-1,0}^{\mu,\gamma}(-z) = \phi(\mu, \nu; z)$, known as Wright function ([1], section 18.1) was introduced by Wright [9].

(iii) $\left(\frac{z}{2} J_{\nu,0}^{1,\gamma} \left(\frac{z^2}{4} \right) \right) = J_{\nu}(z)$, is the ordinary Bessel function (Rainville, [8], pp.109).

(iv) If $\mu = k \in \mathbb{N}$ and $q \in \mathbb{N}$,

$$J_{\nu,q}^{k,\gamma}(z) = \frac{1}{\Gamma(\nu + 1)} {}_qF_k \left[\begin{matrix} \Delta(q; \gamma) \\ \Delta(k; \nu + 1); \end{matrix} -\frac{q^q z}{k^k} \right] \quad (1.3)$$

where, ${}_qF_k(\cdot)$ is the generalized hypergeometric function and the symbol $\Delta(q; \gamma)$ is a q -tuple $\frac{\gamma}{q}, \frac{\gamma+1}{q}, \dots, \frac{\gamma+q-1}{q}; \Delta(k; \nu + 1)$ is a k -tuple $\frac{\nu+1}{k}, \frac{\nu+2}{k}, \dots, \frac{\nu+k}{k}$.

Convergence criteria for the generalized

hypergeometric function ${}_qF_k$.

(a) If $q \leq k$, the function ${}_qF_k$ converges for $|z| < \infty$.

(b) If $q = k + 1$, the function ${}_qF_k$ converges for $|z| < 1$.

(c) If $q > k + 1$, the function ${}_qF_k$ is divergent for $z \neq 0$.

(d) If $q = k + 1$, the function ${}_qF_k$ is absolutely convergent on the unit circle $|z| = 1$, if

$$\operatorname{Re} \left(\sum_{j=1}^k \frac{\nu + j}{k} - \sum_{i=1}^q \frac{\gamma + i - 1}{q} \right) > 0.$$

$$\begin{aligned} \text{(v)} \quad J_{\nu,q}^{\mu,\gamma}(z) &= \frac{1}{\Gamma(\gamma)} {}_1\Psi_1 \left[\begin{matrix} (\gamma, q) \\ (\nu + 1, \mu n) \end{matrix}; -z \right] \\ &= \frac{1}{\Gamma(\gamma)} H_{1,2}^{1,1} \left[\begin{matrix} (1 - \gamma, q) \\ (0, 1), (-\nu, \mu) \end{matrix}; z \right] \end{aligned} \quad (1.4)$$

where ${}_1\Psi_1(\cdot)$ and $H_{1,2}^{1,1}(\cdot)$ are respectively Wright generalized hypergeometric function [10] and H -function [6].

(vi) $J_{\nu-1,q}^{\mu,\gamma}(-z) = E_{\mu,\nu}^{\gamma,q}(z)$, where $\alpha, \beta, \gamma \in \mathbb{C}$; $\operatorname{Re}(\alpha) > 0, \operatorname{Re}(\beta) > 0, \operatorname{Re}(\gamma) > 0$ and $q \in (0, 1) \cup \mathbb{N}$, was given by Shukla and Prajapati [3].

$J_{\nu-1,1}^{\mu,\gamma}(-z) = E_{\mu,\nu}^{\gamma}(z)$, was introduced by Prabhakar [17].

$J_{\nu-1,1}^{\mu,1}(-z) = E_{\mu,\nu-1}(z)$, where $(\alpha, \beta \in \mathbb{C}; \operatorname{Re}(\alpha) > 0, \operatorname{Re}(\beta) > 0)$, was studied by Wiman [2].

$J_{0,1}^{\mu,1}(-z) = E_{\mu}(z)$, where $z \in \mathbb{C}$ and $\operatorname{Re}(\alpha) > 0$, was introduced by Ghosta Mittag-Leffler [11].

(vii) $t^{\mu-1} J_{\mu-1}^{\mu,1}(az^{\mu}) = F_{\mu}[-a, z], \mu > 0$, was studied by Robotnov [18], with respect to hereditary integrals for application to solid mechanics.

In the investigation of various properties and relations of the function $J_{\nu,q}^{\mu,\gamma}(z)$, we need the following well known fact.

Beta transform (Sneddon [13]): The Beta (Euler) transform of the function $f(z)$ is defined by

$$B\{f(z); a, b\} = \int_0^1 z^{a-1} (1-z)^{b-1} f(z) dz \quad (1.5)$$

where, $\operatorname{Re}(a) > 0, \operatorname{Re}(b) > 0$.

Laplace transform (Sneddon [13]): The Laplace transform of the function $f(z)$ is defined as

$$L\{f(z)\} = \int_0^{\infty} e^{-sz} f(z) dz. \quad (1.6)$$

K-Trasform (Meijer [7]): The K -transform is defined by the following integral equation

$$R_{\nu}\{f(x); p\} = \int_0^{\infty} (px)^{\frac{1}{2}} K_{\nu}(px) f(x) dx \quad (1.7)$$

where p is a complex parameter and $K_{\nu}(z)$ represent a modified Bessel function of third kind defined by ([7], p.28, eq.1.168).

Varma Trasform (Meijer [8]): The transform is defined by the integral equation

$$\begin{aligned} V(f, k, m; s) &= \int_0^{\infty} (sx)^{m-\frac{1}{2}} \exp\left(-\frac{1}{2}sx\right) W_{k,m}(sx) f(x) dx, \end{aligned} \quad (1.8)$$

where $W_{k,m}(z)$ represents a Wittaker function defined by ([5], p.55, eq.2.39).

Riemann-Liouville fractional derivative and integral (see, Samko, Kilbas and Marichev ([16], sect. 2)), for $\alpha \in \mathbb{C}, \operatorname{Re}(\alpha) > 0$:

The operators are defined by

$$(I_{0+}^{\alpha} f)(x) = \frac{1}{\Gamma(\alpha)} \int_0^x \frac{f(t)}{(x-t)^{1-\alpha}} dt; \quad (1.9)$$

$$(I_{-}^{\alpha} f)(x) = \frac{1}{\Gamma(\alpha)} \int_x^{\infty} \frac{f(t)}{(t-x)^{1-\alpha}} dt; \quad (1.10)$$

$$(D_{0+}^{\alpha} f)(x) = \left(\frac{d}{dx}\right)^{[\alpha]+1} \left(I_{0+}^{1-\{\alpha\}} f\right)(x)$$

$$= \frac{1}{\Gamma(1-\{\alpha\})} \left(\frac{d}{dx}\right)^{[\alpha]+1} \int_0^x \frac{f(t)}{(x-t)^{\{\alpha\}}} dt; \quad (1.11)$$

$$(D_-^\alpha f)(x) = \left(\frac{d}{dx}\right)^{[\alpha]+1} (I_-^{1-\{\alpha\}} f)(x)$$

$$= \frac{1}{\Gamma(1-\{\alpha\})} \left(-\frac{d}{dx}\right)^{[\alpha]+1} \int_x^\infty \frac{f(t)}{(t-x)^{\{\alpha\}}} dt, \quad (1.12)$$

where $[\alpha]$ means the integral part of number α and $\{\alpha\}$ means the fractional part of number α , $0 \leq \{\alpha\} < 1$. The number $\alpha = \{\alpha\} + [\alpha]$.

II. BASIC PROPERTIES

In this section we derive several interesting properties of the function $J_{v,q}^{\mu,\gamma}(z)$.

Theorem(2.1): If $\mu, v, \gamma \in C; Re(\mu) \geq 0, Re(v) \geq -1, Re(\gamma) \geq 0$ and $q \in (0,1) \cup N$ is satisfied, then for $m \in N$

$$\left(\frac{d}{dz}\right)^m J_{v,q}^{\mu,\gamma}(z) = (-1)^m (\gamma)_{qm} J_{v+\mu m,q}^{\mu,\gamma+qm}(z) \quad (2.1.1)$$

$$J_{v,q}^{\mu,\gamma}(z) = (v+1)J_{v+1,q}^{\mu,\gamma}(z) + \mu z \frac{d}{dz} J_{v+1,q}^{\mu,\gamma}(z) \quad (2.1.2)$$

$$J_{v,q}^{\mu,\gamma}(z) - J_{v,q}^{\mu,\gamma-1}(z)$$

$$= -zq \sum_{n=0}^{\infty} \frac{(\gamma)_{qn+q-1}}{\Gamma(\mu n + \mu + v + 1)} \frac{(-z)^n}{n!} \quad (2.1.3)$$

In particular,

$$J_{v,1}^{\mu,\gamma-1}(z) - J_{v,1}^{\mu,\gamma}(z) = z J_{v+\mu,1}^{\mu,\gamma}(z) \quad (2.1.4)$$

Proof: From (1.2),

$$\left(\frac{d}{dz}\right)^m J_{v,q}^{\mu,\gamma}(z) = \sum_{n=m}^{\infty} \frac{(-1)^n (\gamma)_{qn}}{\Gamma(\mu n + v + 1)} \frac{(z)^{n-m}}{(n-m)!}$$

$$= (-1)^m (\gamma)_{qm} \sum_{n=0}^{\infty} \frac{(\gamma + qm)_{qn}}{\Gamma(\mu n + v + \mu m + 1)} \frac{(-z)^n}{n!}$$

$$= (-1)^m (\gamma)_{qm} J_{v+\mu m,q}^{\mu,\gamma+qm}(z)$$

which is a proof of (2.1.1);

$$(v+1)J_{v+1,q}^{\mu,\gamma}(z) + \mu z \frac{d}{dz} J_{v+1,q}^{\mu,\gamma}(z)$$

$$= (v+1) \sum_{n=0}^{\infty} \frac{(\gamma)_{qn}}{\Gamma(\mu n + v + 2)} \frac{(-z)^n}{n!}$$

$$+ \mu z \frac{d}{dz} \sum_{n=0}^{\infty} \frac{(\gamma)_{qn}}{\Gamma(\mu n + v + 2)} \frac{(-z)^n}{n!}$$

$$= (v+1) \sum_{n=0}^{\infty} \frac{(\gamma)_{qn}}{\Gamma(\mu n + v + 2)} \frac{(-z)^n}{n!}$$

$$+ \mu n \sum_{n=0}^{\infty} \frac{(\gamma)_{qn}}{\Gamma(\mu n + v + 2)} \frac{(-z)^n}{n!}$$

$$= J_{v,q}^{\mu,\gamma}(z)$$

which proves (2.1.2).

Now,

$$J_{v,q}^{\mu,\gamma}(z) - J_{v,q}^{\mu,\gamma-1}(z)$$

$$= \sum_{n=0}^{\infty} \frac{(\gamma)_{qn} (-z)^n}{n! \Gamma(\mu n + v + 1)} - \sum_{n=0}^{\infty} \frac{(\gamma-1)_{qn} (-z)^n}{n! \Gamma(\mu n + v + 1)}$$

$$= q \sum_{n=1}^{\infty} \frac{(\gamma)_{qn-1}}{\Gamma(\mu n + v + 1)} \frac{(-z)^n}{(n-1)!}$$

$$= -qz \sum_{n=0}^{\infty} \frac{(\gamma)_{qn+q-1}}{\Gamma(\mu n + \mu + v + 1)} \frac{(-z)^n}{n!}$$

which proves (2.1.3).

In particular, if $q = 1$ in (2.1.3), which at once yield (2.1.4).

Theorem(2.2): If $\mu, v, \gamma, \delta \in C; Re(\mu) \geq 0, Re(v) \geq -1, Re(\gamma) \geq 0, Re(\delta) \geq 0$ and $q \in (0,1) \cup N$ is satisfied, then

$$\frac{1}{\Gamma(\delta)} \int_0^1 (\omega)^\nu (1-\omega)^{\delta-1} J_{v,q}^{\mu,\gamma}(z\omega^\mu) d\omega$$

$$= J_{v+\delta,q}^{\mu,\gamma}(z), \quad (2.2.1)$$

If, $\mu, v, \gamma, \delta, \alpha \in C; Re(\mu) \geq 0, Re(v) \geq -1, Re(\gamma) \geq 0, Re(\delta) \geq 0$ and $q \in (0,1) \cup N$ is satisfied, then

$$\frac{1}{\Gamma(\delta)} \int_t^x (x-s)^{\delta-1} (s-t)^\nu J_{v,q}^{\mu,\gamma}[\alpha(s-t)^\mu] d$$

$$= (x - t)^{\delta+\nu} J_{\nu+\delta,q}^{\mu,\gamma} [\alpha(x - t)^\mu], \quad (2.2.2)$$

If $\mu, \nu, \gamma, \delta, \lambda \in C; Re(\mu) \geq 0, Re(\nu) \geq -1, Re(\gamma) \geq 0, Re(\delta), Re(\lambda) \geq 0$ and $q = 1$ is satisfied, then

$$\int_0^x (t)^\lambda (x - t)^\nu J_{\nu,q}^{\mu,\gamma} [\omega(x - t)^\mu] J_{\lambda,q}^{\mu,\delta} [\omega t^\mu] dt = x^{\lambda+\nu+1} J_{\lambda+\nu+1,q}^{\mu,\gamma+\delta} (-\omega x^\mu), \quad (2.2.3)$$

If $\mu, \nu, \gamma, \delta \in C; Re(\mu) \geq 0, Re(\nu) \geq -1, Re(\gamma) \geq 0, Re(\delta) \geq 0$ and $q \in (0,1) \cup N$ is satisfied, then

$$\int_0^z (t)^\nu J_{\nu,q}^{\mu,\gamma} (\omega t^\mu) dt = z^{\nu+1} J_{\nu+1,q}^{\mu,\gamma} (\omega z^\mu). \quad (2.2.4)$$

Proof: By using the beta function, L.H.S. of (2.2.1) becomes

$$\frac{1}{\Gamma(\delta)} \sum_{n=0}^{\infty} \frac{(\gamma)_{qn}}{\Gamma(\mu n + \nu + 1)} \frac{(-z)^n}{n!} B(\mu n + \nu + 1, \delta) = \sum_{n=0}^{\infty} \frac{(\gamma)_{qn}}{\Gamma(\mu n + \nu + \delta + 1)} \frac{(-z)^n}{n!} = J_{\nu+\delta,q}^{\mu,\gamma} (z)$$

which is the proof of (2.2.1).

By changing the variable $s = t + \omega(x - t)$, the L.H.S. of (2.2.2) becomes

$$\frac{1}{\Gamma(\delta)} \sum_{n=0}^{\infty} \frac{(\gamma)_{qn} (-\alpha(x - t)^\mu)^n}{n! \Gamma(\mu n + \nu + 1)} \times \int_0^1 (x - t)^{\delta+\nu} (1 - \omega)^{\delta-1} (\omega)^{\mu n + \nu} d\omega = \frac{(x - t)^{\delta+\nu}}{\Gamma(\delta)} \sum_{n=0}^{\infty} \frac{(\gamma)_{qn} (-\alpha(x - t)^\mu)^n}{n! \Gamma(\mu n + \nu + 1)} \times B(\mu n + \nu + 1, \delta)$$

which yield (2.2.2).

Consider,

$$\int_0^x (t)^\lambda (x - t)^\nu J_{\nu,q}^{\mu,\gamma} [\omega(x - t)^\mu] J_{\lambda,q}^{\mu,\delta} [\omega t^\mu] dt = \sum_{n,k=0}^{\infty} \frac{(\gamma)_{qn} (\delta)_{qk}}{\Gamma(\mu n + \nu + 1) \Gamma(\mu k + \lambda + 1)} \frac{(-\omega)^{n+k}}{n! k!}$$

$$\times \int_0^x (t)^{\mu k + \lambda} (x - t)^{\mu n + \nu} dt$$

$$= (x)^{\lambda+\nu+1} \sum_{n,k=0}^{\infty} \frac{(\gamma)_{qn} (\delta)_{qk}}{\Gamma(\mu n + \nu + 1) \Gamma(\mu k + \lambda + 1)} \times \frac{(-\omega x^\mu)^{n+k}}{n! k!} B(\mu k + \lambda + 1, \mu n + \nu + 1)$$

$$= (x)^{\lambda+\nu+1} \sum_{n,k=0}^{\infty} \frac{(\gamma)_{qn} (\delta)_{qk}}{\Gamma(\mu n + \mu k + \lambda + \nu + 2)} \frac{(-\omega x^\mu)^{n+k}}{n! k!}$$

$$= (x)^{\lambda+\nu+1} \sum_{n=0}^{\infty} \sum_{k=0}^n \binom{n}{k} \frac{(\gamma)_{q(n-k)} (\delta)_{qk}}{\Gamma(\mu n + \lambda + \nu + 1)} \frac{(-\omega x^\mu)^n}{n!}$$

substituting $q = 1$ and using the identity Carlitz [1],

$$(a + b)_m = \sum_{r=0}^m \binom{m}{r} (a)_r (b)_{m-r}$$

the above equation subsequently yield (2.2.3).

Further,

$$\int_0^z (t)^\nu J_{\nu,q}^{\mu,\gamma} (\omega t^\mu) dt = \sum_{n=0}^{\infty} \frac{(\gamma)_{qn} (-\omega)^n}{n! \Gamma(\mu n + \nu + 1)} \int_0^z (t)^{\mu n + \nu} dt = z^{\nu+1} J_{\nu+1,q}^{\mu,\gamma} (\omega z^\mu)$$

which is a proof of a (2.2.4).

III. INTEGRAL TRANSFORM OF $J_{\nu,q}^{\mu,\gamma}(z)$

In this section, several integral transforms like Beta, Laplace, Varma, Mellin's and K -transform are discussed for the function $J_{\nu,q}^{\mu,\gamma}(z)$ under the following theorem.

Theorem(3.1)(Beta transform): By using the definition of Beta function, one obtain

$$\int_0^1 (z)^{\alpha-1} (1 - z)^{\beta-1} J_{\nu,q}^{\mu,\gamma} (xz^\delta) dz$$

$$= \frac{\Gamma(\beta)}{\Gamma(\gamma)} {}_2\Psi_2 \left[\begin{matrix} (\gamma, q), (\alpha, \delta) \\ (\nu + 1, \mu), (\alpha + \beta, \delta) \end{matrix}; -x \right] \quad (3.1.1)$$

where, $\mu, \nu, \gamma \in \mathbb{C}; \operatorname{Re}(\mu) \geq 0, \operatorname{Re}(\nu) \geq -1, \operatorname{Re}(\gamma) \geq 0, \operatorname{Re}(\alpha) \geq 0, \operatorname{Re}(\beta) \geq 0$ and $q \in (0,1) \cup \mathbb{N}$

Proof: From (1.2) and (1.5), we get

$$\int_0^1 (z)^{\alpha-1} (1-z)^{\beta-1} J_{\nu,q}^{\mu,\gamma}(xz^\delta) dz$$

$$= \sum_{n=0}^{\infty} \frac{(\gamma)_{qn} (-x)^n}{n! \Gamma(\mu n + \nu + 1)} B(\alpha + \delta n, \beta)$$

$$= \frac{\Gamma(\beta)}{\Gamma(\gamma)} {}_2\Psi_2 \left[\begin{matrix} (\gamma, q), (\alpha, \delta) \\ (\nu + 1, \mu), (\alpha + \beta, \delta) \end{matrix}; -x \right]$$

which is (3.1.1).

Particular Cases: If $\mu = \delta$ and $\alpha = \nu + 1$, then the relation (3.1.1) reduces to

$$\int_0^1 (z)^\nu (1-z)^{\beta-1} J_{\nu,q}^{\delta,\gamma}(xz^\delta) dz = \Gamma(\beta) J_{\nu+\beta,q}^{\delta,\gamma}(x) \quad (3.1.2)$$

If $\beta = \nu + 1, \delta = \mu$ and $z = (1-z)$, then the relation (3.1.1) reduces to

$$\int_0^1 (z)^{\alpha-1} (1-z)^\nu J_{\nu,q}^{\mu,\gamma}(x(1-z)^\mu) dz = \Gamma(\alpha) J_{\nu+\alpha,q}^{\mu,\gamma}(x) \quad (3.1.3)$$

Theorem(3.2)(Laplace transform): By using the definition of Laplace transform, one obtain

$$\int_0^{\infty} z^{\alpha-1} e^{-sz} J_{\nu,q}^{\mu,\gamma}(xz^\delta) dz = \frac{s^{-\alpha}}{\Gamma(\gamma)} {}_2\Psi_1 \left[\begin{matrix} (\gamma, q), (\alpha, \delta) \\ (\nu + 1, \mu) \end{matrix}; -\frac{x}{s^\delta} \right] \quad (3.2.1)$$

where, $\mu, \nu, \gamma \in \mathbb{C}; \operatorname{Re}(\mu) \geq 0, \operatorname{Re}(\nu) \geq -1, \operatorname{Re}(\gamma) \geq 0, \operatorname{Re}(\alpha) \geq 0, \operatorname{Re}(s) \geq 0$ and $q \in (0,1) \cup \mathbb{N}$.

Proof: In virtue of (1.2) and (1.6),

$$\begin{aligned} &L\{z^{\alpha-1} J_{\nu,q}^{\mu,\gamma}(xz^\delta)\} \\ &= \int_0^{\infty} e^{-sz} z^{\alpha-1} \sum_{n=0}^{\infty} \frac{(\gamma)_{qn} (-xz^\delta)^n}{n! \Gamma(\mu n + \nu + 1)} dz \\ &= \frac{s^{-\alpha}}{\Gamma(\gamma)} {}_2\Psi_1 \left[\begin{matrix} (\gamma, q), (\alpha, \delta) \\ (\nu + 1, \mu) \end{matrix}; -\frac{x}{s^\delta} \right] \end{aligned}$$

which is (3.2.1).

Particular Cases: If $q = 1, \alpha = \nu + 1, \delta = \mu$ in (3.2.1), reduces to

$$\int_0^{\infty} z^\nu e^{-sz} J_{\nu,1}^{\mu,\gamma}(xz^\mu) dz = s^{-\nu-1} (1 + xs^{-\mu})^{-\gamma} \quad (3.2.2)$$

If $\alpha = \nu + 1, \delta = \mu, \gamma = q = 1, x = \pm t$, in (3.2.1), reduces to

$$\begin{aligned} \int_0^{\infty} z^\nu e^{-sz} J_{\nu,1}^{\mu,1}(\mp t z^\mu) dz &= s^{-\nu-1} \sum_{n=0}^{\infty} \left(\frac{\mp t}{s^\mu} \right)^n \\ &= \frac{s^{-\nu-1}}{1 - \frac{\mp t}{s^\mu}}, \text{ where } \left| \frac{\mp t}{s^\mu} \right| < 1 \\ &= \frac{s^{\mu-\nu-1}}{s^\mu \pm t} \end{aligned} \quad (3.2.3)$$

Theorem(3.3)(K-transform):

$$\int_0^{\infty} t^{\alpha-1} K_\lambda(st) J_{\nu,q}^{\mu,\gamma}(\omega t^\rho) dt = \frac{2^{\alpha-2}}{s^\alpha \Gamma(\gamma)} {}_3\Psi_1 \left[\begin{matrix} (\gamma, q), (\alpha \pm \lambda, \rho) \\ (\nu + 1, \mu) \end{matrix}; -\omega \left(\frac{2}{s} \right)^\rho \right] \quad (3.3.1)$$

where, $\mu, \nu, \gamma, \alpha, \rho \in \mathbb{C}; \operatorname{Re}(\mu) \geq 0, \operatorname{Re}(\nu) \geq -1, \operatorname{Re}(\gamma) \geq 0, \operatorname{Re}(\alpha) \geq 0, \operatorname{Re}(\rho) \geq 0$ and $q \in \mathbb{N}$.

Proof: By changing the variable $st = z$ in L.H.S. of (3.3.1), we get

$$\int_0^{\infty} \left(\frac{z}{s} \right)^{\alpha-1} K_\lambda(z) \sum_{n=0}^{\infty} \frac{(\gamma)_{qn}}{n! \Gamma(\mu n + \nu + 1)}$$

$$\begin{aligned} & \times (-\omega)^n \left(\frac{z}{s}\right)^{\rho n} \left(\frac{1}{s}\right) dz \\ & = s^{-\alpha} \sum_{n=0}^{\infty} \frac{(\gamma)_{qn} \left(-\frac{\omega}{s^\rho}\right)^n}{n! \Gamma(\mu n + \nu + 1)} \int_0^{\infty} (z)^{\alpha + \rho n - 1} K_\lambda(z) dz \end{aligned}$$

Now by using the formula (Mathai and Saxena [4], p.78):

$$\int_0^{\infty} x^{\rho-1} K_\nu(x) dx = 2^{\rho-2} \Gamma\left(\frac{\rho \pm \nu}{2}\right),$$

in the above equation, we obtain the relation (3.3.1).

Theorem(3.4)(Varma transform):

$$\begin{aligned} & \int_0^{\infty} e^{-\frac{st}{2}} t^{\alpha-1} W_{\lambda,\delta}(st) J_{\nu,q}^{\mu,\gamma}(\omega t^\rho) dt \\ & = \frac{s^{-\alpha}}{\Gamma(\gamma)} {}_3\Psi_2 \left[\begin{matrix} (\gamma, q), \left(\frac{1}{2} \pm \delta + \alpha + \rho\right); \\ (\nu + 1, \mu), (1 - \lambda + \alpha, \rho); \end{matrix} -\frac{\omega}{s^\rho} \right] \end{aligned} \tag{3.4.1}$$

where, $\mu, \nu, \gamma, \alpha, \rho \in C; Re(\mu) \geq 0, Re(\nu) \geq -1, Re(\gamma) \geq 0, Re(\alpha) \geq 0, Re(\rho) \geq 0$ and $q \in N$.

Proof: By changing the variable $st = z$ in L.H.S. of (3.4.1), we get

$$\begin{aligned} & \int_0^{\infty} e^{-\frac{z}{2}} \left(\frac{z}{s}\right)^{\alpha-1} W_{\lambda,\delta}(z) \sum_{n=0}^{\infty} \frac{(\gamma)_{qn}}{n! \Gamma(\mu n + \nu + 1)} \\ & \times (-\omega)^n \left(\frac{z}{s}\right)^{\rho n} \left(\frac{1}{s}\right) dz \\ & = s^{-\alpha} \sum_{n=0}^{\infty} \frac{(\gamma)_{qn} \left(-\frac{\omega}{s^\rho}\right)^n}{n! \Gamma(\mu n + \nu + 1)} \\ & \times \int_0^{\infty} e^{-\frac{z}{2}} (z)^{\alpha + \rho n - 1} W_{\lambda,\delta}(z) dz \end{aligned}$$

Now by using the formula (Mathai and Saxena [4], p.79):

$$\int_0^{\infty} e^{-\frac{t}{2}} t^{\nu-1} W_{\lambda,\mu}(t) dt$$

$$\begin{aligned} & = \frac{\Gamma\left(\frac{1}{2} + \mu + \nu\right) \Gamma\left(\frac{1}{2} - \mu + \nu\right)}{\Gamma(1 - \lambda + \nu)}, Re(\nu \pm \mu) > -\frac{1}{2} \end{aligned}$$

in the above equation, we obtain the relation (3.4.1).

IV. FRACTIONAL INTEGRATION AND DERIVATIVE

In this section, we establish several interesting properties of the function $J_{\nu,q}^{\mu,\gamma}(z)$ defined by (1.2) associated with the operator of Riemann-Liouville fractional integrals and derivatives.

Theorem(4.1): Let $\alpha, \mu, \nu, \lambda, \gamma, \omega \in C; Re(\alpha) \geq 0, Re(\mu) \geq 0, Re(\lambda) \geq -1, Re(\nu) \geq 0, Re(\gamma) \geq 0, Re(\delta) \geq 0$, and $q \in N$, then the left sided operator of Riemann-Liouville fractional integral I_{0+}^α is given for $x > 0$ by

$$\begin{aligned} & (I_{0+}^\alpha [t^\nu J_{\lambda,q}^{\mu,\gamma}(\omega t^\delta)])(x) \\ & = \frac{x^{\lambda+\nu}}{\Gamma(\gamma)} {}_2\Psi_2 \left[\begin{matrix} (\gamma, q), (\nu + 1, \delta) \\ (\lambda + 1, \mu), (\alpha + \nu + 1, \delta); \end{matrix} -\omega x^\delta \right] \end{aligned} \tag{4.1.1}$$

Proof: From the relation (1.2) and (1.9), we have

$$\begin{aligned} & (I_{0+}^\alpha [t^\nu J_{\lambda,q}^{\mu,\gamma}(\omega t^\delta)])(x) \\ & = \frac{1}{\Gamma(\alpha)} \int_0^x (x-t)^{\alpha-1} \sum_{n=0}^{\infty} \frac{(\gamma)_{qn} (-\omega)^n (t)^{\delta n + \nu}}{n! \Gamma(\mu n + \lambda + 1)} dt \\ & = \frac{x^{\lambda+\nu}}{\Gamma(\alpha)} \sum_{n=0}^{\infty} \frac{(\gamma)_{qn} (-\omega x^\delta)^n}{n! \Gamma(\mu n + \lambda + 1)} \int_0^1 (z)^{(\delta n + \nu + 1) - 1} \\ & \times (1-z)^{\alpha-1} dz \end{aligned}$$

evaluating the inner integral by beta-function formula, above relation reduces to (4.1.1).

Corollary(1.1): Let $\alpha, \mu, \nu, \gamma, \omega \in C; Re(\alpha) \geq 0, Re(\mu) \geq 0, Re(\nu) \geq -1, Re(\gamma) \geq 0$ and $q \in N$, then there holds the relation

$$(I_{0+}^\alpha [t^\nu J_{\nu,q}^{\mu,\gamma}(\omega t^\mu)])(x) = x^{\alpha+\nu} J_{\alpha+\nu,q}^{\mu,\gamma}(\omega x^\mu) \tag{4.1.2}$$

and

$$\begin{aligned} & (I_{0+}^\alpha [t^\nu J_{\nu,1}^{\mu,\gamma}(\omega t^\mu)])(x) = \frac{1}{\omega} x^{\alpha+\nu-\mu} \\ & \times [J_{\alpha+\nu-\mu,1}^{\mu,\gamma-1}(\omega x^\mu) - J_{\alpha+\nu-\mu,1}^{\mu,\gamma}(\omega x^\mu)] \end{aligned} \tag{4.1.3}$$

Proof: The proof of assertions (4.1.2), is similar to the theorem (4.1) and the proof of assertion (4.1.3) is obtained by virtue of the relation (2.1.4) and (4.1.2).

Theorem(4.2): Let $\alpha, \mu, \nu, \lambda, \gamma, \omega \in C; Re(\alpha) \geq 0, Re(\mu) \geq 0, Re(\lambda) \geq -1, Re(\nu) \geq 0, Re(\gamma) \geq 0, Re(\delta) \geq 0$, and $q \in N$, then the right sided operator of Riemann-Liouville fractional integral I_-^α is given for $x > 0$ by

$$(I_-^\alpha [t^{-\alpha-\nu-1} J_{\lambda,q}^{\mu,\gamma}(\omega t^{-\delta})])(x) = \frac{x^{-\nu-1}}{\Gamma(\gamma)} \times {}_2\Psi_2 \left[\begin{matrix} (\gamma, q), (\nu + 1, \delta) \\ (\lambda + 1, \mu), (\alpha + \nu + 1, \delta) \end{matrix}; -\omega x^{-\delta} \right] \quad (4.2.1)$$

Proof: From the relation (1.2) and (1.10), we have

$$(I_-^\alpha [t^{-\alpha-\nu-1} J_{\lambda,q}^{\mu,\gamma}(\omega t^{-\delta})])(x) = \frac{1}{\Gamma(\alpha)} \times \int_x^\infty (t-x)^{\alpha-1} \sum_{n=0}^\infty \frac{(\gamma)_{qn} (-\omega)^n (t)^{-\delta n - \alpha - \nu - 1}}{n! \Gamma(\mu n + \lambda + 1)} dt$$

$$= \frac{x^{-\nu-1}}{\Gamma(\alpha)} \sum_{n=0}^\infty \frac{(\gamma)_{qn} (-\omega x^{-\delta})^n}{n! \Gamma(\mu n + \lambda + 1)} \times \int_0^1 (z)^{(\delta n + \nu + 1) - 1} (1-z)^{\alpha-1} dz$$

Evaluating the inner integral by beta-function formula, above relation reduces to (4.2.1).

Corollary(1.2): Let $\alpha, \mu, \nu, \gamma, \omega \in C; Re(\alpha) \geq 0, Re(\mu) \geq 0, Re(\nu) \geq -1, Re(\gamma) \geq 0$ and $q \in N$, then there holds the relation

$$(I_-^\alpha [t^{-\alpha-\nu-1} J_{\nu,q}^{\mu,\gamma}(\omega t^{-\mu})])(x) = x^{-\nu-1} J_{\alpha+\nu,q}^{\mu,\gamma}(\omega x^{-\mu}) \quad (4.2.2)$$

and

$$(I_-^\alpha [t^{-\alpha-\nu-1} J_{\nu,1}^{\mu,\gamma}(\omega t^{-\mu})])(x) = \frac{1}{\omega} x^{\mu-\nu-1} [J_{\alpha+\nu-\mu,1}^{\mu,\gamma-1}(\omega x^{-\mu}) - J_{\alpha+\nu-\mu,1}^{\mu,\gamma}(\omega x^{-\mu})] \quad (4.2.3)$$

Theorem(4.3): Let $\alpha, \mu, \nu, \lambda, \gamma, \omega \in C; Re(\alpha) \geq 0,$

$Re(\mu) \geq 0, Re(\lambda) \geq -1, Re(\nu) \geq 0, Re(\gamma) \geq 0,$

$Re(\delta) \geq 0$, and $q \in N$, then the left sided operator of Riemann-Liouville fractional derivative D_{0+}^α is given for $x > 0$ by

$$(D_{0+}^\alpha [t^\nu J_{\lambda,q}^{\mu,\gamma}(\omega t^\delta)])(x) = \frac{(x)^{\nu-\alpha}}{\Gamma(\gamma)} \times {}_2\Psi_2 \left[\begin{matrix} (\gamma, q), (\nu + 1, \delta) \\ (\lambda + 1, \mu), (1 + \nu - \alpha, \delta) \end{matrix}; -\omega x^\delta \right] \quad (4.3.1)$$

Proof: By virtue of (1.2) and (1.11), we have

$$(D_{0+}^\alpha [t^\nu J_{\lambda,q}^{\mu,\gamma}(\omega t^\delta)])(x) = \left(\frac{d}{dx}\right)^{[\alpha]+1} \left(I_{0+}^{1-\{\alpha\}} [t^\nu J_{\lambda,q}^{\mu,\gamma}(\omega t^\delta)]\right)(x)$$

$$= \sum_{n=0}^\infty \frac{(\gamma)_{qn} (-\omega)^n}{n! \Gamma(\mu n + \lambda + 1) \Gamma(1 - \{\alpha\})} \left(\frac{d}{dx}\right)^{[\alpha]+1} \times \int_0^x t^{\delta n + \nu} (x-t)^{-\{\alpha\}} dt$$

$$= \sum_{n=0}^\infty \frac{(\gamma)_{qn} \Gamma(\delta n + \nu + 1) (-\omega)^n}{n! \Gamma(\mu n + \lambda + 1) \Gamma(\delta n + \nu - \{\alpha\} + 2)} \times \left(\frac{d}{dx}\right)^{[\alpha]+1} (x)^{\delta n + \nu - \{\alpha\} + 1}$$

$$= \sum_{n=0}^\infty \frac{(\gamma)_{qn} \Gamma(\delta n + \nu + 1)}{n! \Gamma(\mu n + \lambda + 1) \Gamma(\delta n + \nu - \alpha + 1)} \times (-\omega)^n (x)^{\delta n + \nu - \alpha}$$

$$= \frac{1}{\Gamma(\gamma)} (x)^{\nu-\alpha} \times {}_2\Psi_2 \left[\begin{matrix} (\gamma, q), (\nu + 1, \delta) \\ (\lambda + 1, \mu), (1 + \nu - \alpha, \delta) \end{matrix}; -\omega x^\delta \right] \quad (4.3.1)$$

Corollary(1.3): Let $\alpha, \mu, \nu, \gamma, \omega \in C; Re(\alpha) \geq 0, Re(\mu) \geq 0, Re(\nu) \geq -1, Re(\gamma) \geq 0$ and $q \in N$, then there holds the relation,

$$\begin{aligned}
 (D_{0+}^{\alpha}[t^{\nu}J_{\nu,q}^{\mu,\gamma}(\omega t^{\mu})])(x) &= x^{\nu-\alpha}J_{\nu-\alpha,q}^{\mu,\gamma}(\omega x^{\mu}) \quad (4.3.2) \\
 \text{and} \\
 (D_{0+}^{\alpha}[t^{\nu}J_{\nu,1}^{\mu,\gamma}(\omega t^{\mu})])(x) \\
 &= \frac{1}{\omega}x^{\nu-\mu-\alpha}[J_{\nu-\mu-\alpha,1}^{\mu,\gamma-1}(\omega x^{\mu}) - J_{\nu-\mu-\alpha,1}^{\mu,\gamma}(\omega x^{\mu})] \quad (4.3.3)
 \end{aligned}$$

Theorem(4.4): Let $\alpha, \mu, \nu, \lambda, \gamma, \omega \in C; Re(\alpha) \geq 0, Re(\mu) \geq 0, Re(\lambda) \geq -1, Re(\nu) \geq 0, Re(\gamma) \geq 0, Re(\delta) \geq 0$, and $q \in N$, then the right sided operator of Riemann-Liouville fractional derivative D_{-}^{α} is given for $x > 0$ by

$$\begin{aligned}
 (D_{-}^{\alpha}[t^{\alpha-\nu-1}J_{\lambda,q}^{\mu,\gamma}(\omega t^{-\delta})])(x) \\
 = \frac{1}{\Gamma(\gamma)}(x)^{-\nu-1} {}_2\Psi_2 \left[\begin{matrix} (\gamma, q), (\nu + 1, \delta) \\ (\lambda + 1, \mu), (1 + \nu - \alpha +, \delta) \\ \vdots \\ -\omega x^{-\delta} \end{matrix} \right] \quad (4.4.1)
 \end{aligned}$$

Proof: By virtue of (1.2) and (1.12), we have

$$\begin{aligned}
 (D_{-}^{\alpha}[t^{\alpha-\nu-1}J_{\lambda,q}^{\mu,\gamma}(\omega t^{-\delta})])(x) \\
 = \left(-\frac{d}{dx}\right)^{[\alpha]+1} (I_{-}^{1-\{\alpha\}}[t^{\alpha-\nu-1}J_{\lambda,q}^{\mu,\gamma}(\omega t^{-\delta})])(x) \\
 = \sum_{n=0}^{\infty} \frac{(\gamma)_{qn}(-\omega)^n}{n! \Gamma(\mu n + \lambda + 1) \Gamma(1 - \{\alpha\})} \\
 \times \left(-\frac{d}{dx}\right)^{[\alpha]+1} \int_0^{\infty} t^{-\delta n + \alpha - \nu - 1} (x - t)^{-\{\alpha\}} dt
 \end{aligned}$$

By changing the variable $t = \frac{x}{z}$, the above expression reduces into the form

$$\begin{aligned}
 &= \sum_{n=0}^{\infty} \frac{(\gamma)_{qn} \Gamma(\nu - \alpha + \{\alpha\} + \delta n) (-\omega)^n}{n! \Gamma(\mu n + \lambda + 1) \Gamma(1 + \nu - \alpha + \delta n)} \\
 &\times \left(-\frac{d}{dx}\right)^{[\alpha]+1} (x)^{-\delta n + \alpha - \nu - \{\alpha\}} \\
 &= \sum_{n=0}^{\infty} \frac{(\gamma)_{qn} \Gamma(\nu - \alpha + \{\alpha\} + \delta n)}{n! \Gamma(\mu n + \lambda + 1) \Gamma(1 + \nu - \alpha + \delta n)} \\
 &\frac{\Gamma(1 - \nu + \alpha - \{\alpha\} - \delta n)}{\Gamma(-\nu - \delta n)} (-\omega)^n (x)^{-\delta n - \nu - 1} \quad (4.4.2)
 \end{aligned}$$

By the reflection formula for the gamma-function (see, [16], (1.60)),

$$\begin{aligned}
 \frac{1}{\Gamma(-\nu - \delta n)} &= \frac{\Gamma(1 + \nu + \delta n)}{\Gamma(1 + \nu + \delta n) \Gamma(-\nu - \delta n)} \\
 &= \Gamma(1 + \nu + \delta n) \frac{\text{Sin}[\Gamma(1 + \nu + \delta n)\pi]}{\pi}
 \end{aligned}$$

and

$$\Gamma(\nu - \alpha + \{\alpha\} + \delta n) \Gamma(1 - \nu + \alpha - \{\alpha\} - \delta n)$$

$$= \frac{\pi}{(-1)^{[\alpha]+1} \text{Sin}[\Gamma(1 + \nu + \delta n)\pi]}$$

substituting these relations into (4.4.2), we obtain (4.4.1).

Corollary(1.4): Let $\alpha, \mu, \nu, \gamma, \omega \in C; Re(\alpha) \geq 0, Re(\mu) \geq 0, Re(\nu) \geq -1, Re(\gamma) \geq 0$ and $q \in N$, then there holds the relation

$$\begin{aligned}
 (D_{-}^{\alpha}[t^{\alpha-\nu-1}J_{\nu,q}^{\mu,\gamma}(\omega t^{-\mu})])(x) \\
 = x^{-\nu-1}J_{\nu-\alpha,q}^{\mu,\gamma}(\omega x^{-\mu}) \quad (4.4.3)
 \end{aligned}$$

and

$$\begin{aligned}
 (D_{-}^{\alpha}[t^{\alpha-\nu-1}J_{\nu,1}^{\mu,\gamma}(\omega t^{-\mu})])(x) \\
 = \frac{1}{\omega}x^{\mu-\nu-1}[J_{\nu-\mu-\alpha,1}^{\mu,\gamma-1}(\omega x^{-\mu}) - J_{\nu-\mu-\alpha,1}^{\mu,\gamma}(\omega x^{-\mu})] \quad (4.4.4)
 \end{aligned}$$
