\section*{1. Introduction}

Throughout this paper we consider only finite undirected and simple graphs. Let $G$ be a graph with $p$ vertices and q edges. There are several types of labeling and a detailed survey can be found in Gallian [1].For all terminologies and notations we follow Harary[2]

The concept of "Geometric mean labeling" has been introduced by S. Somasundaram, R .Ponraj and P. Vidhyarani in[6].

In this paper we investigate super Geometric mean labeling behavior of $\mathrm{S}\left[\mathrm{A}\left(\mathrm{Q}_{\mathrm{n}}\right)\right], \mathrm{S}\left[\mathrm{D}\left(\mathrm{Q}_{\mathrm{n}}\right)\right], \mathrm{S}\left[\mathrm{A}\left(\mathrm{D}\left(\mathrm{Q}_{\mathrm{n}}\right)\right)\right]$, Subdivision of triple Quadrilateral snake $S\left[\left(T\left(Q_{n}\right)\right]\right.$ and Subdivision of alternate triple Quadrilateral snake $S\left[A\left(T\left(Q_{n}\right)\right)\right]$.

We will provide a brief summary of definitions and other informations which are necessary for our present investigation.

## Definition : 1.1

A graph $\mathrm{G}=(\mathrm{V}, \mathrm{E})$ with p vertices and q edges is called a "Geometric mean graph" if it is possible to label the vertices $x \in \mathrm{~V}$ with distinct labels $\mathrm{f}(\mathrm{x})$ from $1,2, \ldots, \mathrm{q}+1$ in such a way that when each edge $\mathrm{e}=\mathrm{uv}$ is labeled with, $\mathrm{f}(\mathrm{e}=\mathrm{uv})=\lceil\sqrt{f(u) f(v)}\rceil$ or $\lfloor\sqrt{f(u) f(v)}\rfloor$ then the edge labels are distinct. In this case, " f " is called a "Geometric mean labeling" of G.

## Definition : 1.2

Let $\mathrm{f}: \mathrm{V}(\mathrm{G}) \rightarrow\{1,2, \ldots, \mathrm{p}+\mathrm{q}\}$ be an injective function. For a vertex labeling " f ", the induced edge labeling $\mathrm{f}^{*}(\mathrm{e}=\mathrm{uv})$ is defined by, $\mathrm{f} *(\mathrm{e})=\lceil\sqrt{f(u) f(v)}\rceil$ or $\lfloor\sqrt{f(u) f(v)}]$. Then " f " is called a "Super Geometric mean labeling" if $\{\mathrm{f}(\mathrm{V}(\mathrm{G}))\} \cup\{\mathrm{f}(\mathrm{e}): \mathrm{e} \in \mathrm{E}(\mathrm{G})=\{1,2, \ldots, \mathrm{p}+\mathrm{q}\}$. A graph which admits Super Geometric mean labeling is called "Super Geometric mean graph".

## Definition : 1.3

If $e=u v$ is an edge of $G$ and $w$ is not a vertex of $G$, then $e$ is said to be subdivided when it is replaced by the edges uw and wv. The graph obtained by subdividing each edge of a graph G is called the Subdivision of G and it is denoted by $\mathrm{S}(\mathrm{G})$.
For example

A Quadrilateral snake $Q_{n}$ is obtained from a path $u_{1} u_{2} \ldots u_{n}$ by joining $u_{i}$ and $u_{i+1}$ with two new vertices $v_{i}$ and $\mathrm{w}_{\mathrm{i}}$ respectively and then joining $\mathrm{v}_{\mathrm{i}}$ and $\mathrm{w}_{\mathrm{i}}, 1 \leq i \leq \mathrm{n}-1$. That is every edge of a path is replaced by a cycle $\mathrm{C}_{4}$.

## Definition : 1.5

An Alternate Quadrilateral snake $A\left(Q_{n}\right)$ is obtained from a path $u_{1} u_{2} \ldots u_{n}$ by joining $u_{i}$ and $u_{i+1}$ alternatively with two new vertices $v_{i}$ and $w_{i}$ respectively and then joining $v_{i}$ and $w_{i}$. That is every alternate edge of a path is replaced by a cycle $\mathrm{C}_{4}$.

## 2. Main Results

Theorem : 2.1
Subdivision of Alternate Quadrilateral snake $\mathrm{S}\left[\mathrm{A}\left(\mathrm{Q}_{\mathrm{n}}\right)\right]$ is a Super Geometric mean graph.

## Proof:

Let $A\left(Q_{n}\right)$ be an Alternate Quadrilateral snake which is obtained from a path $\quad P_{n}=u_{1} u_{2} \ldots u_{n}$ by joining $u_{i}$ and $u_{i+1}$ alternatively with two new vertices $v_{i}$ and $w_{i}$ respectively and then joining $v_{i}$ and $w_{i}$.

Let $\mathrm{S}\left[\mathrm{A}\left(\mathrm{Q}_{\mathrm{n}}\right)\right]=\mathrm{A}\left(\mathrm{Q}_{\mathrm{N}}\right)=\mathrm{G}$ be a graph obtained by subdividing all the edges of $\mathrm{A}\left(\mathrm{Q}_{\mathrm{n}}\right)$. Here we consider the following cases.
Case 1: If $\mathrm{Q}_{\mathrm{n}}$ starts from $\mathrm{u}_{1}$,
Let $\mathrm{t}_{\mathrm{i}}, 1 \leq i \leq \mathrm{n}-1$ be the vertices which subdivide the edges $\mathrm{u}_{\mathrm{i}} \mathrm{u}_{\mathrm{i}+1}$.
Let $\mathrm{x}_{\mathrm{i}}, \mathrm{y}_{\mathrm{i}}$ and $\mathrm{z}_{\mathrm{i}}$ be the vertices which subdivide the edges $\mathrm{u}_{2 \mathrm{i}-1} \mathrm{v}_{\mathrm{i}}, \mathrm{u}_{2 \mathrm{i}} \mathrm{w}_{\mathrm{i}}$ and $\mathrm{v}_{\mathrm{i}} \mathrm{w}_{\mathrm{i}}$ respectively.
We have to consider two subcases.
Subcase (1) (a): If ' $n$ ' is odd, then.
Define a function $\mathrm{f}: \mathrm{V}(\mathrm{G}) \rightarrow\{1,2, \ldots, \mathrm{p}+\mathrm{q}\}$ by,

$$
\begin{aligned}
& \mathrm{f}\left(\mathrm{u}_{2 \mathrm{i}-1}\right)=19 i-18,1 \leq i \leq\left(\frac{n-1}{2}\right)+1 \\
& \mathrm{f}\left(\mathrm{u}_{2 \mathrm{i}}\right)=19 i-3,1 \leq i \leq\left(\frac{n-1}{2}\right) \\
& \mathrm{f}\left(\mathrm{t}_{2 \mathrm{i}-1}\right)=19 i-5,1 \leq i \leq\left(\frac{n-1}{2}\right) \\
& \mathrm{f}\left(\mathrm{t}_{2 \mathrm{i}}\right)=19 i-1,1 \leq i \leq\left(\frac{n-1}{2}\right) \\
& \mathrm{f}\left(\mathrm{x}_{1}\right)=4
\end{aligned}
$$

$$
\begin{aligned}
& \mathrm{f}\left(\mathrm{x}_{\mathrm{i}}\right)=19 i-16,2 \leq i \leq\left(\frac{n-1}{2}\right) \\
& \mathrm{f}\left(\mathrm{y}_{\mathrm{i}}\right)=19 i-7,1 \leq i \leq\left(\frac{n-1}{2}\right) \\
& \mathrm{f}\left(\mathrm{v}_{1}\right)=6 \\
& \mathrm{f}\left(\mathrm{v}_{\mathrm{i}}\right)=19 i-14,2 \leq i \leq\left(\frac{n-1}{2}\right) \\
& \mathrm{f}\left(\mathrm{z}_{\mathrm{i}}\right)=19 i-11,1 \leq i \leq\left(\frac{n-1}{2}\right) \\
& \mathrm{f}\left(\mathrm{w}_{\mathrm{i}}\right)=19 i-9,1 \leq i \leq\left(\frac{n-1}{2}\right)
\end{aligned}
$$

The labeling pattern of $\mathrm{S}\left[\mathrm{A}\left(\mathrm{Q}_{7}\right)\right]$ is shown in the following figure.

Figure: 1
From the above labeling pattern, we get $\{\mathrm{f}(\mathrm{V}(\mathrm{G}))\} \cup\{\mathrm{f}(\mathrm{e}): \mathrm{e} \in \mathrm{E}(\mathrm{G})\}=\{1,2, \ldots, \mathrm{p}+\mathrm{q}\}$
$\therefore$ In this case, " f " provides a Super Geometric mean labeling of $\mathrm{A}\left(\mathrm{Q}_{\mathrm{N}}\right)$.
Subcase (1) (b): If ' $n$ ' is even, then
Define a function $\mathrm{f}: \mathrm{V}(\mathrm{G}) \rightarrow\{1,2, \ldots, \mathrm{p}+\mathrm{q}\}$ by,

$$
\begin{aligned}
& \mathrm{f}\left(\mathrm{u}_{2 \mathrm{i}-1}\right)=19 i-18,1 \leq i \leq\left(\frac{n}{2}\right) \\
& \mathrm{f}\left(\mathrm{u}_{2 \mathrm{i}}\right)=19 i-3 \quad 1 \leq i \leq\left(\frac{n}{2}\right) \\
& \mathrm{f}\left(\mathrm{t}_{2 \mathrm{i}-1}\right)=19 i-5,1 \leq i \leq\left(\frac{n}{2}\right) \\
& \mathrm{f}\left(\mathrm{t}_{2 \mathrm{i}}\right)=19 i-1,1 \leq i \leq\left(\frac{n-2}{2}\right) \\
& \mathrm{f}\left(\mathrm{x}_{1}\right)=4 \\
& \mathrm{f}\left(\mathrm{x}_{\mathrm{i}}\right)=19 i-16,2 \leq i \leq\left(\frac{n}{2}\right) \\
& \mathrm{f}\left(\mathrm{y}_{\mathrm{i}}\right)=19 i-7,1 \leq i \leq\left(\frac{n}{2}\right) \\
& \mathrm{f}\left(\mathrm{v}_{1}\right)=6 \\
& \mathrm{f}\left(\mathrm{v}_{\mathrm{i}}\right)=19 i-14,2 \leq i \leq\left(\frac{n}{2}\right) \\
& \mathrm{f}\left(\mathrm{z}_{\mathrm{i}}\right)=19 i-11,1 \leq i \leq\left(\frac{n}{2}\right) \\
& \mathrm{f}\left(\mathrm{w}_{\mathrm{i}}\right)=19 i-9,1 \leq i \leq\left(\frac{n}{2}\right)
\end{aligned}
$$

The labeling pattern of $\mathrm{S}\left[\mathrm{A}\left(\mathrm{Q}_{8}\right)\right]$ is given below.

Figure: 2
From the above labeling pattern we get, $\{\mathrm{f}(\mathrm{V}(\mathrm{G}))\} \cup(\mathrm{f}(\mathrm{e}): \mathrm{e} \in \mathrm{E}(\mathrm{G})\}=\{1,2, \ldots, \mathrm{p}+\mathrm{q}\}$
In this case, $\mathrm{A}\left(\mathrm{Q}_{\mathrm{N}}\right)$ is a Super Geometric mean graph.

Case 2: If $\mathrm{Q}_{\mathrm{n}}$ starts from $\mathrm{u}_{2}$,
Let $\mathrm{t}_{\mathrm{i}}, 1 \leq i \leq \mathrm{n}-1$ be the vertices which subdivide the edges $\mathrm{u}_{\mathrm{i}} \mathrm{u}_{\mathrm{i}+1}$.
Let $x_{i}, y_{i}$ and $z_{i}$ be the vertices which subdivide the edges $u_{2 i} v_{i}, u_{2 i+1} w_{i}$ and $v_{i} w_{i}$ respectively.
Here we have to consider two subcases.
Subcase (2) (a) If ' $n$ ' is odd, then
Define a function $\mathrm{f}: \mathrm{V}(\mathrm{G}) \rightarrow\{1,2, \ldots, \mathrm{p}+\mathrm{q}\}$ by,

$$
\begin{aligned}
& \mathrm{f}\left(\mathrm{u}_{2 \mathrm{i}-1}\right)=19 i-18,1 \leq i \leq\left(\frac{n-1}{2}\right)+1 \\
& \mathrm{f}\left(\mathrm{u}_{2 \mathrm{i}}\right)=19 i-14,1 \leq i \leq\left(\frac{n-1}{2}\right) \\
& \mathrm{f}\left(\mathrm{t}_{2 \mathrm{i}-1}\right)=19 i-16,1 \leq i \leq\left(\frac{n-1}{2}\right) \\
& \mathrm{f}\left(\mathrm{t}_{2 \mathrm{i}}\right)=19 i-1,1 \leq i \leq\left(\frac{n-1}{2}\right) \\
& \mathrm{f}\left(\mathrm{x}_{\mathrm{i}}\right)=19 i-12,1 \leq i \leq\left(\frac{n-1}{2}\right) \\
& \mathrm{f}\left(\mathrm{y}_{\mathrm{i}}\right)=19 i-3,1 \leq i \leq\left(\frac{n-1}{2}\right) \\
& \mathrm{f}\left(\mathrm{v}_{\mathrm{i}}\right)=19 i-10,1 \leq i \leq\left(\frac{n-1}{2}\right) \\
& \mathrm{f}\left(\mathrm{z}_{\mathrm{i}}\right)=19 i-7,1 \leq i \leq\left(\frac{n-1}{2}\right) \\
& \mathrm{f}\left(\mathrm{w}_{\mathrm{i}}\right)=19 i-5,1 \leq i \leq\left(\frac{n-1}{2}\right)
\end{aligned}
$$

The labeling pattern of $S\left[A\left(Q_{7}\right)\right]$ is displayed below.

Figure: 3
From the above labeling pattern, we get $\{\mathrm{f}(\mathrm{V}(\mathrm{G}))\} \cup\{\mathrm{f}(\mathrm{e}): \mathrm{e} \in \mathrm{E}(\mathrm{G})\}=\{1,2, \ldots, \mathrm{p}+\mathrm{q}\}$.
Hence $\mathrm{A}\left(\mathrm{Q}_{\mathrm{N}}\right)$ admits a Super Geometric mean labeling.
Subcase (2) (b) If ' $n$ ' is even, then
Define a function $\mathrm{f}: \mathrm{V}(\mathrm{G}) \rightarrow\{1,2, \ldots, \mathrm{p}+\mathrm{q}\}$ by,

$$
\begin{aligned}

& \mathrm{f}\left(\mathrm{u}_{2 \mathrm{i}}\right)=19 i-14,1 \leq i \leq\left(\frac{n}{2}\right) \\
& \mathrm{f}\left(\mathrm{t}_{2 \mathrm{i}-1}\right)=19 i-16,1 \leq i \leq\left(\frac{n}{2}\right) \\
& \mathrm{f}\left(\mathrm{t}_{2 \mathrm{i}}\right)=19 i-1,1 \leq i \leq\left(\frac{n-2}{2}\right) \\
& \mathrm{f}\left(\mathrm{x}_{\mathrm{i}}\right)=19 i-12,1 \leq i \leq\left(\frac{n-2}{2}\right) \\
& \mathrm{f}\left(\mathrm{y}_{\mathrm{i}}\right)=19 i-3,1 \leq i \leq\left(\frac{n-2}{2}\right) \\
& \mathrm{f}\left(\mathrm{v}_{\mathrm{i}}\right)=19 i-10,1 \leq i \leq\left(\frac{n-2}{2}\right) \\
& \mathrm{f}\left(\mathrm{z}_{\mathrm{i}}\right)=19 i-7,1 \leq i \leq\left(\frac{n-2}{2}\right) \\
& \mathrm{f}\left(\mathrm{w}_{\mathrm{i}}\right)=19 i-5,1 \leq i \leq\left(\frac{n-2}{2}\right)
\end{aligned}
$$

The labeling pattern of $S\left[A\left(Q_{8}\right)\right]$ is shown below.

Figure: 4
From the above labeling pattern, both vertices and edges together get distinct labels from $\{1,2, \ldots, p+q\}$.
From all the above cases, we conclude that Subdivision of Alternate Quadrilateral snake is a Super
Geometric mean graph.
Theorem : 2.2

$$

From the above labeling pattern, we get $\{\mathrm{f}(\mathrm{V}(\mathrm{G}))\} \cup\{\mathrm{f}(\mathrm{e}): \mathrm{e} \in \mathrm{E}(\mathrm{G})\}=\{1,2, \ldots, \mathrm{p}+\mathrm{q}\}$.
Hence $D\left(Q_{N}\right)$ is a Super Geometric mean graph.

Let $T\left(Q_{n}\right)$ be a Triple Quadrilateral snake which is obtained from a path $P_{n}=u_{1} u_{2} \ldots u_{n}$ by joining $u_{i}$ and $u_{i+1}$ with six new vertices $v_{i}, w_{i}, x_{i}, y_{i}, a_{i}$ and $b_{i}, 1 \leq i \leq n-1$ by the edges $u_{i} v_{i}, v_{i} w_{i}, w_{i} u_{i+1}, u_{i} a_{i}, a_{i} b_{i}, b_{i} u_{i+1}, u_{i} u_{i+1}, u_{i} x_{i}, x_{i} y_{i}$ and $y_{i} u_{i+1}$.

The labeling pattern of $\mathrm{S}\left[\mathrm{A}\left(\mathrm{T}\left(\mathrm{Q}_{5}\right)\right)\right.$ is shown below.

Figure : 13
From the above labeling pattern, both vertices and edges together get distinct labels from $\{1,2, \ldots, p+q\}$. This makes " f " a Super Geometric mean labeling of G.

Subcase (2) (a): If ' $n$ ' is even, then
Define a function $\mathrm{f}: \mathrm{V}(\mathrm{G}) \rightarrow\{1,2, \ldots, \mathrm{p}+\mathrm{q}\}$ by,
$\mathrm{f}\left(\mathrm{u}_{2 \mathrm{i}-1}\right)=41 i-40,1 \leq i \leq\left(\frac{n}{2}\right)$
$\mathrm{f}\left(\mathrm{u}_{2 \mathrm{i}}\right)=41 i-36,1 \leq i \leq\left(\frac{n}{2}\right)$
$\mathrm{f}\left(\mathrm{t}_{2 \mathrm{i}-1}\right)=41 i-38,1 \leq i \leq\left(\frac{n}{2}\right)$
$\mathrm{f}\left(\mathrm{t}_{\mathrm{i}}\right)=41 i-9,1 \leq i \leq\left(\frac{n-2}{2}\right)$
$\mathrm{f}\left(\mathrm{m}_{\mathrm{i}}\right)=41 i-20,1 \leq i \leq\left(\frac{n-2}{2}\right)$
$\mathrm{f}\left(\mathrm{n}_{\mathrm{i}}\right)=41 i-1,1 \leq i \leq\left(\frac{n-2}{2}\right)$
$\mathrm{f}\left(\mathrm{x}_{\mathrm{i}}\right)=41 i-18,1 \leq i \leq\left(\frac{n-2}{2}\right)$
$\mathrm{f}\left(\mathrm{q}_{\mathrm{i}}\right)=41 i-14,1 \leq i \leq\left(\frac{n-2}{2}\right)$
$\mathrm{f}\left(\mathrm{y}_{\mathrm{i}}\right)=41 i-8,1 \leq i \leq\left(\frac{n-2}{2}\right)$
$\mathrm{f}\left(\mathrm{r}_{\mathrm{i}}\right)=41 i-26,1 \leq i \leq\left(\frac{n-2}{2}\right)$
$\mathrm{f}\left(\mathrm{s}_{\mathrm{i}}\right)=41 i-3,1 \leq i \leq\left(\frac{n-2}{2}\right)$
$\mathrm{f}\left(\mathrm{v}_{\mathrm{i}}\right)=41 i-16,1 \leq i \leq\left(\frac{n-2}{2}\right)$
$\mathrm{f}\left(\mathrm{z}_{\mathrm{i}}\right)=41 i-13,1 \leq i \leq\left(\frac{n-2}{2}\right)$
$\mathrm{f}\left(\mathrm{w}_{\mathrm{i}}\right)=41 i-7,1 \leq i \leq\left(\frac{n-2}{2}\right)$
$\mathrm{f}\left(\mathrm{l}_{\mathrm{i}}\right)=41 i-34,1 \leq i \leq\left(\frac{n-2}{2}\right)$

$$
\begin{aligned}
& \mathrm{f}\left(\mathrm{~g}_{\mathrm{i}}\right)=41 i-21,1 \leq i \leq\left(\frac{n-2}{2}\right) \\
& \mathrm{f}\left(\mathrm{a}_{\mathrm{i}}\right)=41 i-31,1 \leq i \leq\left(\frac{n-2}{2}\right) \\
& \mathrm{f}\left(\mathrm{k}_{1}\right)=14 \\
& \mathrm{f}\left(\mathrm{k}_{\mathrm{i}}\right)=41 i-28,2 \leq i \leq\left(\frac{n-2}{2}\right) \\
& \mathrm{f}\left(\mathrm{~b}_{1}\right)=17 \\
& \mathrm{f}\left(\mathrm{~b}_{\mathrm{i}}\right)=41 i-25,2 \leq i \leq\left(\frac{n-2}{2}\right)
\end{aligned}
$$

The labeling pattern of $\mathrm{S}\left[\mathrm{A}\left(\mathrm{T}\left(\mathrm{Q}_{8}\right)\right]\right.$ is shown below.

Figure: 14

From the above labeling pattern we get, $\{\mathrm{f}(\mathrm{V}(\mathrm{G}))\} \cup\{\mathrm{f}(\mathrm{e}): \mathrm{e} \in \mathrm{E}(\mathrm{G})\}=\{1,2, \ldots, \mathrm{p}+\mathrm{q}\}$
Hence G admits a Super Geometric mean labeling.
From all the above cases, we conclude that Subdivision of Alternate Triple Quadrilateral snake is a Super Geometric mean graph.
