#### Abstract

The Adomian Decomposition Method (ADM) is used to analysis the nonlinear singular systems of time-invariant and time-varying cases [14]. The obtained discrete solutions using $A D M$ and Single-term Haar wavelet series (STHW) are compared with the exact solutions of the nonlinear singular systems of time-invariant and time-varying cases. It is found that the solution obtained using ADM is closer to the exact solutions of the nonlinear singular systems of time-invariant and time-varying cases. Error graphs for discrete and exact solutions are presented in a graphical form to highlight the efficiency of this method. This ADM can be easily implemented in a digital computer and the solution can be obtained for any length of time.

Keywords - Nonlinear singular systems of timeinvariant and time-varying cases, Singular systems, Adomian Decomposition Method, Single-term Haar wavelet series.

## I. Introduction

There is an ever widening use of simulation, design and analysis packages. Frequently many mathematical models appearing as appearing as mixed system of nonlinear algebraic and differential equations or what is called the nonlinear singular systems. This has been one of the driving forces behind the work on singular systems over the last decade.

The development of singular nonlinear systems has been studied by some researchers [2, 5-6]. But no were closed-form solution available in that paper. In some analysis of neural networks, both singular systems [7] and nonlinear systems [19] have been used. The multipliers and algebraic interconnections between singular systems and nonlinear systems are allowed in dynamical systems. For singular bilinear systems, Lewis et al. [9] have been discussed extensively in the literature. However, the solution given by Lewis et al. [10] only applies for the timeinvariant case.
In this paper we developed numerical methods for addressing nonlinear singular systems of timeinvariant and time-varying cases by an application of the Adomian Decomposition Method which was studied by Sekar and team of his researchers [12-13, 15-17]. Recently, Sekar et al. [14] discussed the nonlinear singular systems of time-invariant and time-
varying cases using STHW. In this paper, the same nonlinear singular systems of time-invariant and timevarying cases problem was considered (discussed by Sekar et al. [14]) but present a different approach using the Adomian Decomposition Method with more accuracy for nonlinear singular systems of timeinvariant and time-varying cases.

## II. Adomian Decomposition Method

Suppose $k$ is a positive integer and $f_{1}, f_{2}, \ldots, f_{k}$ are $k$ real continuous functions defined on some domain $G$. To obtain $k$ differentiable functions $y_{1}, y_{2}, \ldots, y_{k}$ defined on the interval $I$ such that $\left(t, y_{1}(t), y_{2}(t), \ldots, y_{k}(t)\right) \in G$ for $t \in I$.
Let us consider the problems in the following system of ordinary differential equations:

$$
\begin{array}{r}
\frac{d y_{i}(t)}{d t}=f_{i}\left(t, y_{1}(t), y_{2}(t), \ldots, y_{k}(t)\right), \\
\left.y_{i}(t)\right|_{t=0}=\beta_{i}
\end{array}
$$

where $\beta_{i}$ is a specified constant vector, $y_{i}(t)$ is the solution vector for $i=1,2, \ldots, k$. In the decomposition method, (1) is approximated by the operators in the form: $L y_{i}(t)=f_{i}\left(t, y_{1}(t), y_{2}(t), \ldots, y_{k}(t)\right)$ where $L$ is the first order operator defined by $L=d / d t$ and $i=1,2, \ldots, k$.
Assuming the inverse operator of $L$ is $L^{-1}$ which is invertible and denoted by $L^{-1}()=.\int_{t_{0}}^{t}() d$.$t , then$ applying $L^{-1}$ to $L y_{i}(t)$ yields

$$
L^{-1} L y_{i}(t)=L^{-1} f_{i}\left(t, y_{1}(t), y_{2}(t), \ldots, y_{k}(t)\right)
$$

where $i=1,2, \ldots, k$. Thus

$$
y_{i}(t)=y_{i}\left(t_{0}\right)+L^{-1} f_{i}\left(t, y_{1}(t), y_{2}(t), \ldots, y_{k}(t)\right)
$$

Hence the decomposition method consists of representing $y_{i}(t)$ in the decomposition series form given by

$$
y_{i}(t)=\sum_{n=0}^{\infty} f_{i, n}\left(t, y_{1}(t), y_{2}(t), \ldots, y_{k}(t)\right)
$$

where the components $y_{i, n}, n \geq 1$ and $i=1,2, \ldots, k$ can be computed readily in a recursive manner. Then the series solution is obtained as

$$
y_{i}(t)=y_{i, 0}(t)+\sum_{n=1}^{\infty}\left\{L^{-1} f_{i, n}\left(t, y_{1}(t), y_{2}(t), \ldots, y_{k}(t)\right)\right\}
$$

For a detailed explanation of decomposition method and a general formula of Adomian polynomials, we refer reader to [Adomian 1].

## III. NONLINEAR Singular Systems

The time-invariant non-linear singular systems of the form is considered

$$
\begin{equation*}
K \dot{x}(t)=A x(t)+f(x(t)) \tag{5.1}
\end{equation*}
$$

with $x(0)=x_{0}$, where K is an $n \times n$ singular matrix, A is an $n \times n$ matrix, $x(t)$ is an $\mathrm{n}-$ state vector and f is an " n " vector function. In order to make the above system (5.1) as time-varying case some of the components (not necessarily all the elements) in the system (5.1) are converted, as time-varying and then the system will be of the following form

$$
\begin{equation*}
K(t) \dot{x}(t)=A(t) x(t)+f(x(t)) \tag{5.2}
\end{equation*}
$$

with $x(0)=x_{0}$, where this $K(t)$ is an $n \times n$ singular matrix, $A(t)$ is an $n \times n$ matrix, $x(t)$ is an $\mathrm{n}-$ state vector and $f$ is an " n " vector function.

## IV. Numerical Examples for Time-Invariant

Considering the following time-invariant nonlinear singular system (Campbell [3,4], Lin and Yang [11]) $K=\left[\begin{array}{ll}0 & 1 \\ 0 & 0\end{array}\right], A=\left[\begin{array}{cc}-1 & 0 \\ 0 & 2\end{array}\right]$ and $f(x(t))=\left[\begin{array}{c}0 \\ -x^{2}\end{array}\right]$ with initial condition $x(0)=\left[\begin{array}{l}0 \\ 0\end{array}\right]$.

$$
x_{1}(t)=-t
$$

The exact solutions are

$$
x_{2}(t)=\frac{t^{2}}{2}
$$

## V. Numerical Examples for Time-varying

Considering the time-varying nonlinear singular system of the following form (Hsiao and Wang [8] and Sepehrian and Razzaghi [18])
$\left[\begin{array}{ccc}0 & 1 & 0 \\ 0 & 0 & t^{2} \\ 0 & 0 & 0\end{array}\right] \dot{x}(t)=\left[\begin{array}{c}t x_{1}(t)+x_{2}(t) \\ \exp (t) x_{1}(t) x_{2}(t) \\ x_{2}(t)\left(x_{1}(t)+x_{3}(t)\right)\end{array}\right] x(t)+\left[\begin{array}{c}0 \\ 2 t^{2} \exp (-t) \\ 0\end{array}\right]$,
with initial condition

$$
x(0)=\left[\begin{array}{c}
2 \\
0 \\
-2
\end{array}\right]
$$

The exact solutions are

$$
x(t)=\left[\begin{array}{c}
2 \exp (-t)(1-t) \\
t^{2} \exp (-t) \\
-2 \exp (-t)(1-t)
\end{array}\right]
$$

## VI.Conclusions

The obtained results (discrete solutions) of the nonlinear singular systems for time-invariant and time-varying cases show that the ADM works well for finding the state vector. From tables $1-5$, we can observe that for most of the time intervals, the absolute error is less (almost no error) in the ADM when compared to the STHW, which yields a small error, along with the exact solutions. From Fig. 1-5, one can predict that the error is much less in the ADM when compared to the STHW methods discussed by Sekar et al. [14].
Hence the ADM is more suitable for studying the time-invariant and time-varying nonlinear singular systems.

## Acknowledgment

The authors gratefully acknowledge the Dr. A. Murugesan, Assistant Professor, Department of Mathematics, Government Arts College (Autonomous), Salem - 636 007, for encouragement and support. The authors also heartfelt thank to Dr. S. Mehar Banu, Assistant Professor, Department of Mathematics, Government Arts College for Women (Autonomous), Salem - 636 008, Tamil Nadu, India, for her kind help and suggestions.
