#### Abstract

A radio labeling of a graph $G$ is an injective function $f: V(G) \rightarrow N \cup\{0\}$ such that for every $u, v \in V, \mid f(u)-$ $\mathrm{f}(\mathrm{v}) \mid \geq \operatorname{diam}(\mathrm{G})+1-\mathrm{d}(\mathrm{u}, \mathrm{v})$. In this paper we investigate Radio mean square labeling of some graphs such as incentric Subdivision of spoke wheel graph and Bi-wheel graph .

Keywords : Radio labeling, Radio number, Radio Mean labeling, Radio mean square labeling.
AMS Subject Classification : 05C78

## I. Introduction

By a graph $\mathrm{G}=(\mathrm{V}(\mathrm{G}), \mathrm{E}(\mathrm{G}))$ with P vertices and q edges we mean a simple, connected and undirected graph. The distance between two vertices $x$ and $y$ of G is denoted by $\mathrm{d}(\mathrm{x}, \mathrm{y})$ and diam( G$)$ indicate the diameter of G. Radio labeling is motivated by the channel assignment problem introduced by Hale(1980). Chartrand et. al. investigated the upper bound for the radio number of path $\mathrm{P}_{\mathrm{n}}$. The exact value for the radio number of path was given by Liu and Zhu[4]. R. Ponraj and S. Kala[3] have introduced the notion of Radio Mean labeling of graphs. In this paper we investigate Radio mean square labeling of some graphs such as incentric Subdivision of spoke wheel graph and Bi-wheel graph.
Definition 1.1 [3] A Radio mean labeling is a one to one mapping $\mathrm{f}: \mathrm{V}(\mathrm{G}) \rightarrow \mathrm{N}$ satisfying the condition $\mathrm{d}(\mathrm{u}, \mathrm{v})+\left\lceil\frac{\mathrm{f}(\mathrm{u})+\mathrm{f}(\mathrm{v})}{2}\right\rceil \geq 1+\operatorname{diam}(\mathrm{G})$, for every
$\mathrm{u}, \mathrm{v} \in \mathrm{V}(\mathrm{G})$.
Definition 1.2 A radio mean square labeling is a one to one mapping $f$ from $V(G)$ to $N$ Satisfying the condition $\mathrm{d}(\mathrm{u}, \mathrm{v})+\left\lceil\frac{(\mathrm{f}(\mathrm{u}))^{2}+(\mathrm{f}(\mathrm{v}))^{2}}{2}\right\rceil \geq 1+\operatorname{diam}(\mathrm{G})$, for every
$\mathrm{u}, \mathrm{v} \in \mathrm{V}(\mathrm{G})$. The radio mean square number of G is denoted by $\mathrm{rmsn}(\mathrm{G})$

## 2.RadioMean Square Labeling of incentric Subdivision of spoke wheel graphs

Definition 2.1 Incentric subdivision is the graph obtained by inserting a vertex of degree two into every edge inside the original graph. If every edge inside a wheel graph is subdivided then the resulting graph is called incentric subdivision of spoke wheel graph.

Definition 2.2 The graph $\operatorname{SS}\left(\mathrm{W}_{\mathrm{n}}\right)$ is obtained from the wheel $\mathrm{W}_{\mathrm{n}}$ by subdividing each spokes by a vertex. Let $\mathrm{W}_{\mathrm{n}}=\mathrm{C}_{\mathrm{n}}+\mathrm{K}_{1}$ where $\mathrm{C}_{\mathrm{n}}=\mathrm{v}_{1} \mathrm{v}_{2} \ldots . \mathrm{v}_{\mathrm{n}} \mathrm{v}_{1}$ and $\mathrm{V}\left(\mathrm{K}_{1}\right)=\{\mathrm{u}\}$ and the spokes are subdivided by the vertices $u_{i}(1 \leq i \leq n)$.

Note that the diameter of $\operatorname{SS}\left(\mathrm{W}_{\mathrm{n}}\right)$ is 4 .
Theorem 2.1 $\operatorname{rmsn}\left(S S\left(W_{n}\right)\right)=2 n+1, n \geq 8$
Proof Let $u$ be the centre vertex. The cyclic vertices are $v_{1}, v_{2}, \ldots v_{n}$ and the vertices of subdivision of spokes are $u_{1}, u_{2}, \ldots u_{n}$.

Clearly $\operatorname{SS}\left(\mathrm{W}_{\mathrm{n}}\right)$ has $2 \mathrm{n}+1$ vertices and $\operatorname{diam}\left(\mathrm{SS}\left(\mathrm{W}_{\mathrm{n}}\right)\right)=4$

Define the radio mean labeling $\mathrm{f}: \mathrm{V} \rightarrow \mathrm{N}$ satisfying the condition
$\mathrm{d}(\mathrm{u}, \mathrm{v})+\left\lceil\frac{(\mathrm{f}(\mathrm{u}))^{2}+(\mathrm{f}(\mathrm{v}))^{2}}{2}\right\rceil \geq 1+\operatorname{diam}\left(\mathrm{SS}\left(\mathrm{W}_{\mathrm{n}}\right)\right)=5$ for every pair of distinct vertices $u$ and $v$.

Consider the rim vertices $\mathrm{v}_{\mathrm{i}} \quad(1 \leq \mathrm{i} \leq \mathrm{n})$
Define the radio mean labeling $\mathrm{f}: \mathrm{V} \rightarrow \mathrm{N}$ by
$f\left(v_{i}\right)=\left\{\begin{array}{ccc}1 & \text { if } & i=1 \\ n-i & \text { if } & i=2 \\ n-i+2 & \text { if } & i=3 \\ 2 & \text { if } & i=4 \\ n & \text { if } & i=5 \\ i-3 & \text { if } & i=6,7, \ldots n\end{array}\right.$
$\mathrm{f}\left(\mathrm{u}_{\mathrm{i}}\right)=\mathrm{n}+\mathrm{i}, \mathrm{i}=1,2, \ldots, \mathrm{n}$ and $\mathrm{f}(\mathrm{u})=2 \mathrm{n}+1$
Now we check the radio mean square condition for the above labeling $f$.
Case 1 Consider the pair $\left(u_{i}, u_{j}\right)$
Subcase a Verify the pair $\left(\mathrm{v}_{1}, \mathrm{v}_{\mathrm{i}}\right)$.
It is easy to verify that the pairs $\left(\mathrm{v}_{1}, \mathrm{v}_{\mathrm{i}}\right), \mathrm{i}=4,6,7,8$
For $\mathrm{i} \notin\{4,6,7,8\}$ we have

$$
\mathrm{d}\left(\mathrm{v}_{1}, \mathrm{v}_{\mathrm{i}}\right)+\left\lceil\frac{\left(\mathrm{f}\left(\mathrm{v}_{1}\right)\right)^{2}+\left(\mathrm{f}\left(\mathrm{v}_{\mathrm{i}}\right)\right)^{2}}{2}\right\rceil \geq 1+\left\lceil\frac{1+36}{2}\right\rceil \geq 20
$$

Subcase b Verify the pair $\left(\mathrm{v}_{4}, \mathrm{v}_{\mathrm{i}}\right)$
The pairs $\left(\mathrm{v}_{4}, \mathrm{v}_{6}\right),\left(\mathrm{v}_{4}, \mathrm{v}_{7}\right)$ satisfy the radio mean square condition.
For $\mathrm{i} \neq 1,6,7, \mathrm{~d}\left(\mathrm{v}_{4}, \mathrm{v}_{\mathrm{i}}\right)+\left\lceil\frac{\left(\mathrm{f}\left(\mathrm{v}_{4}\right)\right)^{2}+\left(\mathrm{f}\left(\mathrm{v}_{\mathrm{i}}\right)\right)^{2}}{2}\right\rceil \geq 1+\left\lceil\frac{4+25}{2}\right\rceil \geq 16$.
Subcase c Check the pair $\left(\mathrm{v}_{\mathrm{i}}, \mathrm{v}_{\mathrm{j}}\right), \mathrm{i}, \mathrm{j} \notin\{1,4\}$

$$
\mathrm{d}\left(\mathrm{v}_{\mathrm{i}}, \mathrm{v}_{\mathrm{j}}\right)+\left\lceil\frac{\left(\mathrm{f}\left(\mathrm{v}_{\mathrm{i}}\right)\right)^{2}+\left(\mathrm{f}\left(\mathrm{v}_{\mathrm{j}}\right)\right)^{2}}{2}\right\rceil \geq 1+\left\lceil\frac{9+16}{2}\right\rceil \geq 14
$$

Case 2 Check the pair $\left(u_{i}, u_{j}\right)$

$$
\mathrm{d}\left(\mathrm{u}_{\mathrm{i}}, \mathrm{u}_{\mathrm{j}}\right)+\left\lceil\frac{\left(\mathrm{f}\left(\mathrm{u}_{\mathrm{i}}\right)\right)^{2}+\left(\mathrm{f}\left(\mathrm{u}_{\mathrm{j}}\right)\right)^{2}}{2}\right\rceil \geq 2+\left\lceil\frac{(\mathrm{n}+1)^{2}+(\mathrm{n}+2)^{2}}{2}\right\rceil \geq 93
$$

Case 3 Check the pair $\left(v_{i}, u_{j}\right)$

$$
\mathrm{d}\left(\mathrm{v}_{\mathrm{i}}, \mathrm{u}_{\mathrm{j}}\right)+\left\lceil\frac{\left(\mathrm{f}\left(\mathrm{v}_{\mathrm{i}}\right)\right)^{2}+\left(\mathrm{f}\left(\mathrm{u}_{\mathrm{j}}\right)\right)^{2}}{2}\right\rceil \geq 1+\left\lceil\frac{1+(\mathrm{n}+1)^{2}}{2}\right\rceil \geq 42
$$

Case 4 Examine the pair $\left(u, u_{i}\right)$

$$
\mathrm{d}\left(\mathrm{u}, \mathrm{u}_{\mathrm{i}}\right)+\left\lceil\frac{(\mathrm{f}(\mathrm{u}))^{2}+\left(\mathrm{f}\left(\mathrm{u}_{\mathrm{i}}\right)\right)^{2}}{2}\right\rceil \geq 1+\left\lceil\frac{(2 \mathrm{n}+1)^{2}+(\mathrm{n}+1)^{2}}{2}\right\rceil \geq 186
$$

These cases establish the radio mean square condition.
Hence $\operatorname{rmsn}(\mathrm{SS}(\mathrm{Wn})) \leq 2 \mathrm{n}+1$.
Since the number of vertices is $2 \mathrm{n}+1$ and the labels are unique, it follows that $\mathrm{rmsn}(\mathrm{SS}(\mathrm{Wn})) \geq$ $2 \mathrm{n}+1$.

Hence $\operatorname{rmsn}(S S(W n))=2 n+1$
Example 2.1 The radio mean square number of some incentric subdivision of spoke wheel graphs are given in Fig 1

(a) $\operatorname{rmsn}\left(\operatorname{SS}\left(\mathrm{W}_{8}\right)\right)=17$

(b) $\operatorname{rmsn}\left(\mathrm{SS}\left(\mathrm{W}_{9}\right)\right)=19$

Figure 1

## 3. Radio Mean square Labeling of Bi-wheel graph

Definition 3.1 The graph $W_{m, n}$ is obtained from the wheels $W_{m}$ and $W_{n}$ by joining the rim vertices of the two wheels with an edge. Let $W_{m}=C_{m}+K_{1}$ and $W_{n}=C_{n}+K_{1}$ where $C_{m}$ is the cycle $u_{1} u_{2} \ldots u_{m} u_{1}$ and $C_{n}$ is the cycle
$\mathrm{v}_{1} \mathrm{v}_{2} \ldots \mathrm{v}_{\mathrm{n}} \mathrm{v}_{1}$. Let $\mathrm{V}\left(\mathrm{W}_{\mathrm{m}}\right)=\mathrm{V}\left(\mathrm{C}_{\mathrm{m}}\right) \cup\left\{\mathrm{u}_{1}\right\}, \mathrm{V}\left(\mathrm{W}_{\mathrm{n}}\right)=\mathrm{V}\left(\mathrm{C}_{\mathrm{n}}\right) \cup\left\{\mathrm{v}_{1}\right\}$ and
$\mathrm{E}\left(\mathrm{W}_{\mathrm{m}, \mathrm{n}}\right)=\mathrm{E}\left(\mathrm{W}_{\mathrm{m}}\right) \cup \mathrm{E}\left(\mathrm{W}_{\mathrm{n}}\right) \cup\left\{\mathrm{u}_{1} \mathrm{v}_{1}\right\}$.
Definition 3.2 Bi-wheel graph $\mathrm{BW}_{\mathrm{m}, \mathrm{n}}$ [6] consist of two disjoint copies of wheel which are joined by an edge between two rim vertices.

Theorem $3.1 \operatorname{rmsn}\left(\mathrm{~W}_{\mathrm{n}, \mathrm{n}}\right)=2 \mathrm{n}+2$, $\mathrm{n}>3$
Proof: Clearly there are $2 \mathrm{n}+2$ vertices and $\operatorname{diam}\left(\mathrm{BW}_{\mathrm{n}, \mathrm{n}}\right)=5$.
Define $\mathrm{f}: \mathrm{V} \rightarrow \mathrm{N}$ and satisfies the radio mean square condition
$\mathrm{d}(\mathrm{u}, \mathrm{v})+\left\lceil\frac{(\mathrm{f}(\mathrm{u}))^{2}+(\mathrm{f}(\mathrm{v}))^{2}}{2}\right\rceil \geq 1+\operatorname{diam}\left(\mathrm{BW}_{\mathrm{n}, \mathrm{n}}\right)=6$
Let $v$ be the central vertex of second wheel $W_{n}$.
The vertices adjacent to v are labeled sequentially by $\left\{\mathrm{v}_{1}, \mathrm{v}_{2}, \ldots, \mathrm{v}_{\mathrm{n}}\right\}$ in counter clockwise direction.

Let $u$ be the central vertex of first wheel $W_{n}$.
The vertices adjacent to $u$ are labeled sequentially by $\left\{u_{1}, u_{2}, \ldots, u_{n}\right\}$ in clockwise direction respectively.

First consider the vertices of $\mathrm{W}_{\mathrm{n}}$. Define $\mathrm{f}: \mathrm{V} \rightarrow \mathrm{N}$ by
$f\left(v_{i}\right)=\left\{\begin{array}{ccc}3 & \text { if } & i=1 \\ n+i & \text { if } & i=2 \\ 2 & \text { if } & i=3 \\ i+1 & \text { if } & 4 \leq i \leq n\end{array} \quad, f(v)=n+3\right.$
$f\left(u_{i}\right)=\left\{\begin{array}{ccc}4 & \text { if } & i=1 \\ 2 n+i-1 & \text { if } & i=2 \\ 1 & \text { if } & i=3 \\ n+i & \text { if } & 4 \leq i \leq n\end{array} \quad, f(u)=2 n+2\right.$
We check the radio mean square condition $d(u, v)+\left\lceil\frac{(f(u))^{2}+(f(v))^{2}}{2}\right\rceil \geq 6$ holds for every pairs ( $u, v$ ) with $u \neq v$.

Case a Examine the pair $\left(u, u_{i}\right)$,
$\mathrm{d}\left(\mathrm{u}, \mathrm{u}_{\mathrm{i}}\right)+\left\lceil\frac{(\mathrm{f}(\mathrm{u}))^{2}+\left(\mathrm{f}\left(\mathrm{u}_{\mathrm{i}}\right)\right)^{2}}{2}\right\rceil \geq 1+\left\lceil\frac{(\mathrm{n}+4)^{2}+1}{2}\right\rceil \geq 34$
Case bexamine the pair $\left(u_{i}, u_{j}\right)$, Clearly $\left(u_{3}, u_{1}\right)$ satisfies the radio mean square condition.
Subcase 1 Examine the pair $\left(u_{3}, u_{i}\right), i \neq 1$

$$
\mathrm{d}\left(\mathrm{u}_{3}, \mathrm{u}_{\mathrm{i}}\right)+\left\lceil\frac{\left(\mathrm{f}\left(\mathrm{u}_{3}\right)\right)^{2}+\left(\mathrm{f}\left(\mathrm{u}_{\mathrm{i}}\right)\right)^{2}}{2}\right\rceil \geq 1+\left\lceil\frac{1+(\mathrm{n}+4)^{2}}{2}\right\rceil \geq 34
$$

Subcase 2 Examine the pair $\left(\mathrm{u}_{1}, \mathrm{u}_{\mathrm{i}}\right), \mathrm{i} \neq 3$

$$
\mathrm{d}\left(\mathrm{u}_{1}, \mathrm{u}_{\mathrm{i}}\right)+\left\lceil\frac{\left(\mathrm{f}\left(\mathrm{u}_{1}\right)\right)^{2}+\left(\mathrm{f}\left(\mathrm{u}_{\mathrm{i}}\right)\right)^{2}}{2}\right\rceil \geq 1+\left\lceil\frac{16+(\mathrm{n}+4)^{2}}{2}\right\rceil \geq 41
$$

Subcase 3 Check the pair $\left(u_{i}, u_{j}\right), i, j \notin\{1,3\}$
$\mathrm{d}\left(\mathrm{u}_{\mathrm{i}}, \mathrm{u}_{\mathrm{j}}\right)+\left\lceil\frac{\left(\mathrm{f}\left(\mathrm{u}_{\mathrm{i}}\right)\right)^{2}+\left(\mathrm{f}\left(\mathrm{u}_{\mathrm{j}}\right)\right)^{2}}{2}\right\rceil \geq 1+\left\lceil\frac{(\mathrm{n}+4)^{2}+(\mathrm{n}+5)^{2}}{2}\right\rceil \geq 74$
Case c Consider the pair $\left(\mathrm{u}_{\mathrm{i}}, \mathrm{v}_{\mathrm{j}}\right)$
Subcase 1 Verify the pair $\left(u_{3}, v_{3}\right)$ satisfies the radio mean square condition. So take $\mathrm{j} \neq 3$.

$$
\mathrm{d}\left(\mathrm{u}_{3}, \mathrm{v}_{\mathrm{j}}\right)+\left\lceil\frac{\left(\mathrm{f}\left(\mathrm{u}_{3}\right)\right)^{2}+\left(\mathrm{f}\left(\mathrm{v}_{\mathrm{j}}\right)\right)^{2}}{2}\right\rceil \geq 3+\left\lceil\frac{1+9}{2}\right\rceil \geq 8
$$

Subcase 2 Examine the pair $\left(u_{1}, v_{j}\right)$
Since $d\left(u_{1}, v_{3}\right)=3,\left(u_{1}, v_{3}\right)$ satisfies the radio mean square condition.
Consider $\left(\mathrm{u}_{1}, \mathrm{v}_{\mathrm{j}}\right)$ with $\mathrm{j} \neq 3$

$$
\mathrm{d}\left(\mathrm{u}_{1}, \mathrm{v}_{\mathrm{j}}\right)+\left\lceil\frac{\left(\mathrm{f}\left(\mathrm{u}_{1}\right)\right)^{2}+\left(\mathrm{f}\left(\mathrm{v}_{\mathrm{j}}\right)\right)^{2}}{2}\right\rceil \geq 1+\left\lceil\frac{16+9}{2}\right\rceil \geq 13
$$

Subcase 3 Check the pair $\left(\mathrm{u}_{\mathrm{i}}, \mathrm{v}_{\mathrm{j}}\right)$, $\mathrm{i} \neq 1,3$

$$
\mathrm{d}\left(\mathrm{u}_{\mathrm{i}}, \mathrm{v}_{\mathrm{j}}\right)+\left\lceil\frac{\left(\mathrm{f}\left(\mathrm{u}_{\mathrm{i}}\right)\right)^{2}+\left(\mathrm{f}\left(\mathrm{v}_{\mathrm{j}}\right)\right)^{2}}{2}\right\rceil \geq 2+\left\lceil\frac{(\mathrm{n}+4)^{2}+9}{2}\right\rceil \geq 39
$$

Case d Consider the pair $\left(u, v_{j}\right)$,
Similar to subcase 3 of case c
Case e Consider the pair $\left(u_{i}, v\right)$

$$
\mathrm{d}\left(\mathrm{u}_{\mathrm{i}}, \mathrm{v}\right)+\left\lceil\frac{\left(\mathrm{f}\left(\mathrm{u}_{\mathrm{i}}\right)\right)^{2}+(\mathrm{f}(\mathrm{v}))^{2}}{2}\right\rceil \geq 2+\left\lceil\frac{1+(\mathrm{n}+3)^{2}}{2}\right\rceil \geq 27
$$

Case f Check the pair ( $u, v$ )
$\mathrm{d}(\mathrm{u}, \mathrm{v})+\left\lceil\frac{(\mathrm{f}(\mathrm{u}))^{2}+(\mathrm{f}(\mathrm{v}))^{2}}{2}\right\rceil \geq 3+\left\lceil\frac{(2 \mathrm{n}+2)^{2}+(\mathrm{n}+3)^{2}}{2}\right\rceil \geq 78$
Case $g$ Verify the pair $\left(\mathrm{v}, \mathrm{v}_{\mathrm{i}}\right)$
$\mathrm{d}\left(\mathrm{v}, \mathrm{v}_{\mathrm{i}}\right)+\left\lceil\frac{(\mathrm{f}(\mathrm{v}))^{2}+\left(\mathrm{f}\left(\mathrm{v}_{\mathrm{i}}\right)\right)^{2}}{2}\right\rceil \geq 1+\left\lceil\frac{(\mathrm{n}+3)^{2}+4}{2}\right\rceil \geq 28$
Case $h$ Examine the pair $\left(v_{i}, v_{j}\right)$
Subcase 1 Consider to check that the pair $\left(\mathrm{v}_{1}, \mathrm{v}_{3}\right)$
It is easy to check that the pair $\left(\mathrm{v}_{1}, \mathrm{v}_{3}\right)$ satisfies the radio mean square condition.
Subcase 2 Verify the pair $\left(v_{3}, v_{j}\right), j \neq 1$
$\mathrm{d}\left(\mathrm{v}_{3}, \mathrm{v}_{\mathrm{j}}\right)+\left\lceil\frac{\left(\mathrm{f}\left(\mathrm{v}_{3}\right)\right)^{2}+\left(\mathrm{f}\left(\mathrm{v}_{\mathrm{j}}\right)\right)^{2}}{2}\right\rceil \geq 1+\left\lceil\frac{4+25}{2}\right\rceil \geq 16$
Subcase 3 Examine the pair $\left(\mathrm{v}_{1}, \mathrm{v}_{\mathrm{j}}\right), \mathrm{j} \neq 3$
$\mathrm{d}\left(\mathrm{v}_{1}, \mathrm{v}_{\mathrm{j}}\right)+\left\lceil\frac{\left(\mathrm{f}\left(\mathrm{v}_{1}\right)\right)^{2}+\left(\mathrm{f}\left(\mathrm{v}_{\mathrm{j}}\right)\right)^{2}}{2}\right\rceil \geq 1+\left\lceil\frac{9+25}{2}\right\rceil \geq 18$
Subcase 4 Check the pair $\left(v_{i}, v_{j}\right), i \neq 1,3$ and $j \neq 1,3$
$\mathrm{d}\left(\mathrm{v}_{\mathrm{i}}, \mathrm{v}_{\mathrm{j}}\right)+\left\lceil\frac{\left(\mathrm{f}\left(\mathrm{v}_{\mathrm{i}}\right)\right)^{2}+\left(\mathrm{f}\left(\mathrm{v}_{\mathrm{j}}\right)\right)^{2}}{2}\right\rceil \geq 1+\left\lceil\frac{25+36}{2}\right\rceil \geq 32$
Hence these cases establishes the radio mean square condition.
Therefore $\operatorname{rmsn}\left(\mathrm{BW}_{\mathrm{n}, \mathrm{n}}\right) \leq 2 \mathrm{n}+2$
Since $\operatorname{diam}\left(B W_{n, n}\right)=5$, it follows that 1 and 2 cannot be labels of the same wheel.
This implies $\mathrm{rmsn}\left(\mathrm{BW}_{\mathrm{n}, \mathrm{n}}\right)>2 \mathrm{n}+1$
But $\operatorname{rmsn}\left(\mathrm{BW}_{\mathrm{n}, \mathrm{n}}\right) \leq 2 \mathrm{n}+2$
Hence $\operatorname{rmsn}\left(\mathrm{BW}_{\mathrm{n}, \mathrm{n}}\right)=2 \mathrm{n}+2$
Example 3.1 For the graph $\mathrm{BW}_{11,11}$ in Fig $2, \operatorname{rmsn}\left(\mathrm{BW}_{11,11}\right)=24$

Fig 2
Observation $\quad \operatorname{rmsn}\left(\mathrm{BW}_{\mathrm{n}, \mathrm{n}}\right)=\operatorname{rmsn}\left(\mathrm{BW}_{\mathrm{n}-1, \mathrm{n}-1}\right)+2$
