### 1.1 INTRODUCTION

In this chapter we prove that every finite distributive lattice D can be represented as the congruence lattice of finite uniform lattice $L$. Infact we prove that "For any finite distributive lattice D , there exists a finite uniform lattice L such that the congruence lattice of $L$ is isomorphic to $D$, and L satisfies the properties $(\mathrm{P})$ and $(\mathrm{Q})$ where
(P) Every join-irreducible congruence of L we introduce a very simple kind of chopped lattices. we prove that the ideal lattice of this chopped lattice is uniform.
is of the form $q(0, p)$, for a suitable atom $p$ of $L$.
(Q) If $q_{1}, q_{2}, \ldots \ldots \ldots \ldots, q_{n} \in \mathbb{J}$ (ConL)
are pairwise incomparable, then L contains atoms $p_{1}, p_{2}, \ldots \ldots \ldots, p_{n}$ that generate an ideal isomorphic to $\mathrm{B}_{\mathrm{n}}$ and satisfy $\mathrm{q}_{\mathrm{i}}=\mathrm{q}\left(0, \mathrm{p}_{\mathrm{i}}\right)$, for all $\mathrm{i} £ \mathrm{n}$.

To prove this result, we introduce a new lattice construction which is described. Then we find the congruences on this new lattice

## NOTATIO

N :
$B_{n}$ will denote the Boolean algebra with $2^{n}$ elements. For a bounded lattice A with bounds 0 and

1, $A^{-}$will denote the lattice $A-$ $\{0,1\}$

We start with the definition of uniform
lattices.
PROOF OF THE MAIN RESULT

THEOREM : 1.2
For any finite distributive lattice D , there exists a finite uniform lattice $L$ such that the congruence lattice of $L$ is isomorphic to $D$ and $L$ satisfies the properties (P) and (Q) where
(P) : Every join-irreducible congruence of
$L$ is of the form $q(0, p)$, for a suitable atom $p$ of $L$.
$(\mathrm{Q}):$ If $\mathrm{q}_{1}, \mathrm{q}_{2}, \ldots, \mathrm{q}_{\mathrm{n}} \in \mathrm{J}(\mathrm{ConL})$ are pairwise incomparable, then L contains atoms $\mathrm{p}_{1}, \mathrm{p}_{2}, \ldots, \mathrm{p}_{\mathrm{n}}$ that generate an ideal isomorphic to $B_{n}$ and satisfy $\mathrm{q}_{\mathrm{i}}=\mathrm{q}\left(0, \mathrm{p}_{\mathrm{i}}\right)$, for all i£n.

## Proof:-

We prove the result using induction on $n$, where n is the number of join-irreducible elements.

Let D be a finite distributive lattice with n join-irreducible elements.

If $n=1$, then $D @ B_{1}$, so there is a lattice
$\mathrm{L}=\mathrm{B}_{1}$ that satisfies the theorem 1.2.
Let us assume that, for all finite distributive lattices with fewer than $n$ joinirreducible elements, there exists a lattice L satisfying theorem 2.6.1 and properties $(\mathrm{P})$ and $(\mathrm{Q})$.

Assume that $D$ has $n$ join-irreducible elements.

Let $q$ be a minimal element of $J(D)$.
Let $\mathrm{q}_{1}, \mathrm{q}_{2}, \ldots, \mathrm{q}_{\mathrm{k}}(\mathrm{k} \geq 0)$ be all upper bounds of $q$ in $J(D)$.

Let $D_{1}$ be a distributive lattice with
$J\left(D_{1}\right)=J(D)-\{q\}$.
By induction assumption there exists a lattice $\mathrm{L}_{1}$ satisfying Con $\mathrm{L}_{1} @ \mathrm{D}_{1}$ and $(\mathrm{P})$ and $(\mathrm{Q})$.

If $\mathrm{k}=0$, then $\mathrm{D} @ \mathrm{~B}_{1} \times \mathrm{D}_{1}$ and $\mathrm{L}=\mathrm{B}_{1} \times \mathrm{L}_{1}$, obviously satisfies all the requirements of the theorem and so the proof is over.

So, assume $\mathrm{k} \geq 1$
The congruences of $L_{1}$ corresponding to the $\mathrm{q}_{\mathrm{i}}$ 's are pairwise incomparable and therefore can be written in the form $\mathrm{q}\left(0, \mathrm{p}_{\mathrm{i}}\right)$ and the $\mathrm{p}_{\mathrm{i}}$ 's generate an ideal $\mathrm{I}_{1}$ isomorphic to $\mathrm{B}_{\mathrm{k}}$.

The lattice $N\left(B_{2}, B_{k}\right)$ also contains an ideal $\left(B_{k}\right) *$ isomorphic to $B_{k}$.

Identifying $I_{1}$ and $\left(B_{k}\right)_{*}$, We get the chopped lattice K and the lattice $\mathrm{L}=\mathrm{IdK}$.

By lemma IdK is
uniform. That is $L$ is
uniform.
Let $q$ be a join-irreducible congruence of $L$.
Then we can write q as $\mathrm{q}(\mathrm{a}, \mathrm{b})$ where a
is
covered by b.
By lemma., it follows that we can assume that either $a, b \in E L_{1}$, or $a, b \in \mathbb{E}\left(B_{2}, B_{k}\right)$

In either case, there exists an atom q in $\mathrm{L}_{1}$ or $q$ in $N\left(B_{2}, B_{k}\right)$ so that $q(a, b)=q(0, q)$ in $L_{1}$ or $q(a, b)=q(0, q)$ in $N\left(B_{2}, B_{k}\right)$.

Obviously, q is an atom of Land $q(a, b)=q(0, q)$ in $L$ verifying $(P)$ for $L$.

Let $\mathrm{q}_{1}, \mathrm{q}_{2}, \ldots, \mathrm{q}_{\mathrm{t}}$ be pairwise in-comparable join-irreducible congruences of $L$.

To verify condition (Q), we have to find atoms $\mathrm{p}_{1}, \mathrm{p}_{2}, \ldots, \mathrm{p}_{\mathrm{t}}$ of L satisfying $\mathrm{q}_{\mathrm{i}}=$ $\mathrm{q}\left(0, \mathrm{p}_{\mathrm{i}}\right)$ for all $\mathrm{i} £ \mathrm{t}$ and such that $\mathrm{p}_{1}, \mathrm{p}_{2}, \ldots, \mathrm{p}_{\mathrm{t}}$ generate an ideal of $L$ isomorphic to $B_{t}$.

Let $p$ denote an atom in $N\left(B_{2}, B_{k}\right)$ $\mathrm{I}_{1}$

Infact, there are two atoms but they generate the same congruence $q(0, p)$.

If $q(0, p)$ is not one of $\mathrm{q}_{1}, \mathrm{q}_{2}, \ldots \ldots, \mathrm{q}_{\mathrm{t}}$
then clearly we can find
$\mathrm{p}_{1}, \mathrm{p}_{2}, \ldots, \mathrm{p}_{\mathrm{t}}$ in $\mathrm{L}_{1}$ as required and $\mathrm{p}_{1}, \mathrm{P}_{2}$,
....., $\mathrm{p}_{\mathrm{t}}$ also serves in L .
If $\mathrm{q}(0, \mathrm{p})$ is one of $\mathrm{q}_{1}, \mathrm{q}_{2}, \ldots \ldots, \mathrm{q}_{\mathrm{t}}$ say $\mathrm{q}(0, \mathrm{p})=\mathrm{q}_{\mathrm{t}}$, then let $\mathrm{p}_{1}, \mathrm{p}_{2}, \ldots \ldots, \mathrm{p}_{\mathrm{t}-1}$ be the set of atoms establishing (Q) for $\mathrm{q}_{1}, \mathrm{q}_{2}, . ., \mathrm{q}_{\mathrm{t}-1}$ in $\mathrm{L}_{1}$ and therefore in L .

Then $\mathrm{p}_{1}, \mathrm{p}_{2}, \ldots . ., \mathrm{p}_{\mathrm{t}-1}, \mathrm{p}$ represent the
congruences $\mathrm{q}_{1}, \mathrm{q}_{2}, \ldots \ldots, \mathrm{q}_{\mathrm{t}}$ and they generate an ideal isomorphic to $B_{t}$ by lemma.

Therefore L satisfies (Q).
It is clear from this discussion that $J(C o n K)$ has exactly one more element than $J\left(\right.$ ConL $\left._{1}\right)$, namely, $q(0, p)$.

This join-irreducible congruence relates to the join-irreducible congruences of ConL, exactly as $q$ relates to the joinirreducible elements of $D$.

Therefore D @ ConL.
Hence the theorem.

## EXAMPLE :

The uniform construction for the four-element chain is

has 8 blocks.
This lattice has four congruences. $\mathrm{C}_{0}$ has 32 blocks.
$C_{1}=\{\{0,1,2,3\},\{4,5,6,7\},\{8,9,10,11\},\{12,13$
$\mathrm{C}_{0}$ is a null congruence
$14,15\},(16,17,18,19\},\{20,21,22,23\}$,
$\{24,25,26,27\},\{28,29,30,31\}\}$.
$\mathrm{C}_{2}$ has 2 blocks.
$C_{2}=\{\{0,1,2,3,4,5,6,7,8,9,10,1$
1,
$12,13,14,15\},\{16,17,18,19,20,21,22,23,2$
4,
25,26,27,28,29,30,31\}
\}. $\mathrm{C}_{3}$ has 1 block.
$\mathrm{C}_{3}$ is all congruence.

The congruence lattice of this lattice is

Every finite distributive lattice D can be represented as the congruence lattice of a finite uniform lattice L.
