

# On $i\pi q_s$ - Homeomorphism in Intuitionistic Fuzzy Topological spaces

Dr. K. Ramesh

Department of Mathematics, Jayirams Arts and Science college, Karur, Tamilnadu.

**Abstract** - This paper introduces intuitionistic fuzzy  $\pi$  generalized semi homeomorphism and intuitionistic fuzzy  $i\pi$  generalized semi homeomorphism in intuitionistic fuzzy topological spaces. Also they have been related to the fundamental concepts of intuitionistic fuzzy continuous mappings and intuitionistic fuzzy open mappings.

**Keywords** - Intuitionistic fuzzy topology, intuitionistic fuzzy  $\pi$  generalized semi closed set, intuitionistic fuzzy  $\pi$  generalized semi continuous mapping, intuitionistic fuzzy  $\pi$  generalized semi homeomorphism, intuitionistic fuzzy  $i\pi$  generalized semi homeomorphism.

**1.Introduction** The concept of fuzzy sets was introduced by Zadeh [13] and later Atanassov [1] generalized this idea to intuitionistic fuzzy sets using the notion of fuzzy sets. On the other hand Coker [3] introduced intuitionistic fuzzy topological spaces using the notion of intuitionistic fuzzy sets. In this paper we introduce intuitionistic fuzzy  $\pi$  generalized semi homeomorphism and intuitionistic fuzzy  $i\pi$  generalized semi homeomorphism. Also we have studied the relations with the fundamental concepts of intuitionistic fuzzy continuous mappings and intuitionistic fuzzy open mappings. We have arrived at some characterizations of intuitionistic fuzzy  $\pi$  generalized semi homeomorphism.

## 2. Preliminaries

**Definition 2.1:** [1] An intuitionistic fuzzy set (IFS in short)  $A$  in  $X$  is an object having the form  $A = \{ \langle x, \mu_A(x), \nu_A(x) \rangle / x \in X \}$ , where the functions  $\mu_A(x): X \rightarrow [0, 1]$  and  $\nu_A(x): X \rightarrow [0, 1]$  denote the degree of membership (namely  $\mu_A(x)$ ) and the degree of non-

membership (namely  $\nu_A(x)$ ) of each element  $x \in X$  to the set  $A$ , respectively, and  $0 \leq \mu_A(x) + \nu_A(x) \leq 1$  for each  $x \in X$ . Denote by  $IFS(X)$ , the set of all intuitionistic fuzzy sets in  $X$ .

**Definition 2.2:** [1] Let  $A$  and  $B$  be IFSs of the form

$A = \{ \langle x, \mu_A(x), \nu_A(x) \rangle / x \in X \}$  and  $B = \{ \langle x, \mu_B(x), \nu_B(x) \rangle / x \in X \}$ . Then

(a)  $A \subseteq B$  if and only if  $\mu_A(x) \leq \mu_B(x)$  and  $\nu_A(x) \geq \nu_B(x)$  for all  $x \in X$

(b)  $A = B$  if and only if  $A \subseteq B$  and  $B \subseteq A$

(c)  $A^c = \{ \langle x, \nu_A(x), \mu_A(x) \rangle / x \in X \}$

(d)  $A \cap B = \{ \langle x, \mu_A(x) \wedge \mu_B(x), \nu_A(x) \vee \nu_B(x) \rangle / x \in X \}$

(e)  $A \cup B = \{ \langle x, \mu_A(x) \vee \mu_B(x), \nu_A(x) \wedge \nu_B(x) \rangle / x \in X \}$

**Definition 2.3:**[3] An intuitionistic fuzzy topology (IFT in short) on  $X$  is a family  $\tau$  of IFSs in  $X$  satisfying the following axioms.

(i)  $0_., 1_. \in \tau$

(ii)  $G_1 \cap G_2 \in \tau$  for any  $G_1, G_2 \in \tau$

(iii)  $\cup G_i \in \tau$  for any family  $\{ G_i / i \in J \} \subseteq \tau$ .

**Definition 2.4:**[3] Let  $(X, \tau)$  be an IFTS and  $A = \langle x, \mu_A, \nu_A \rangle$  be an IFS in  $X$ . Then the intuitionistic fuzzy interior and intuitionistic fuzzy closure are defined by

$\text{int}(A) = \cup \{ G / G \text{ is an IFOS in } X \text{ and } G \subseteq A \}$ ,

$\text{cl}(A) = \cap \{ K / K \text{ is an IFCS in } X \text{ and } A \subseteq K \}$ .

**Definition 2.5:**[8] An IFS  $A = \langle x, \mu_A, \nu_A \rangle$  in an IFTS  $(X, \tau)$  is said to be an

- (i) intuitionistic fuzzy semi closed set (IFSCS in short) if  $\text{int}(\text{cl}(A)) \subseteq A$ ,
- (ii) intuitionistic fuzzy  $\alpha$ -closed set (IF $\alpha$ CS in short) if  $\text{cl}(\text{int}(\text{cl}(A))) \subseteq A$ .

**Definition 2.6:**[9] An IFS  $A$  in an IFTS  $(X, \tau)$  is said to be an intuitionistic fuzzy  $\pi$ - generalized closed set (IF $\pi$ GSCS in short) if  $\text{scl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is an IF $\pi$ OS in  $(X, \tau)$ .

**Result 2.7:**[9] Let  $A$  be an IFS in  $(X, \tau)$ , then

- (i)  $\text{scl}(A) = A \cup \text{int}(\text{cl}(A))$ ,
- (ii)  $\text{sint}(A) = A \cap \text{cl}(\text{int}(A))$ .

**Result 2.8:** [9] (i) Every IF $\pi$ OS is an IFOS in  $(X, \tau)$ .

- (ii) Every IF $\pi$ CS is an IFCS in  $(X, \tau)$ .

**Definition 2.9:**[8] An IFS  $A$  in an IFTS  $(X, \tau)$  is an

- (i) intuitionistic fuzzy generalized closed set (IFGCS) if  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is an IFOS in  $(X, \tau)$ .
- (ii) intuitionistic fuzzy alpha generalized closed set (IF $\alpha$ GCS) if  $\alpha\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is an IFOS in  $(X, \tau)$ .

**Definition 2.10:**[10] Let  $f$  be a mapping from an IFTS  $(X, \tau)$  into an IFTS  $(Y, \sigma)$ . Then  $f$  is said to be

- (i) intuitionistic fuzzy continuous (IF continuous) if  $f^{-1}(B) \in \text{IFO}(X, \tau)$  for every  $B \in \sigma$ .
- (ii) intuitionistic fuzzy semi continuous (IFS continuous) if  $f^{-1}(B) \in \text{IFSO}(X, \tau)$  for every  $B \in \sigma$ .
- (iii) intuitionistic fuzzy  $\alpha$ -continuous (IF $\alpha$  continuous) if  $f^{-1}(B) \in \text{IF}\alpha\text{O}(X, \tau)$  for every  $B \in \sigma$ .
- (iv) intuitionistic fuzzy generalized continuous (IFG continuous) if  $f^{-1}(B) \in \text{IFGC}(X, \tau)$  for every IFCS  $B$  in  $(Y, \sigma)$ .
- (v) intuitionistic fuzzy generalized semi continuous (IFGS continuous) if  $f^{-1}(B) \in \text{IFGSC}(X, \tau)$  for every IFCS  $B$  in  $(Y, \sigma)$ .

- (vi) intuitionistic fuzzy  $\alpha$ -generalized continuous (IF $\alpha$ G continuous) if  $f^{-1}(B) \in \text{IF}\alpha\text{GC}(X)$  for every IFCS  $B$  in  $(Y, \sigma)$ .

**Definition 2.11:**[10] Let  $f$  be a mapping from an IFTS  $(X, \tau)$  into an IFTS  $(Y, \sigma)$ . Then  $f$  is said to be an intuitionistic fuzzy  $\pi$  generalized semi open mapping (IF $\pi$ GS open mapping) if  $f(A) \in \text{IF}\pi\text{GSOS}(X, \tau)$  for every IFOS  $A$  in  $(X, \tau)$ .

**Definition 2.12:**[11] A mapping  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called an intuitionistic fuzzy  $\pi$ - generalized semi closed mapping (IF $\pi$ GS closed) if  $f(A)$  is an IF $\pi$ GSCS in  $(Y, \sigma)$  for every IFCS  $A$  of  $(X, \tau)$ .

**Definition 2.13:**[9] Let  $f$  be a mapping from an IFTS  $(X, \tau)$  into an IFTS  $(Y, \sigma)$ . Then the map  $f$  is said to be an intuitionistic fuzzy  $\pi$ - generalized semi irresolute (IF $\pi$ GS irresolute in short) if  $f^{-1}(B) \in \text{IF}\pi\text{GCS}(X)$  for every IF $\pi$ GCS  $B$  in  $(Y, \sigma)$ .

**Definition 2.14:**[8] Let  $f$  be a bijection mapping from an IFTS  $(X, \tau)$  into an IFTS  $(Y, \sigma)$ . Then  $f$  is said to be

- (i) intuitionistic fuzzy homeomorphism (IF homeomorphism) if  $f$  and  $f^{-1}$  are IF continuous mappings.
- (ii) intuitionistic fuzzy semi homeomorphism (IFS homeomorphism) if  $f$  and  $f^{-1}$  are IFS continuous mappings.
- (iii) intuitionistic fuzzy alpha homeomorphism (IF $\alpha$  homeomorphism in short) if  $f$  and  $f^{-1}$  are IF $\alpha$  continuous mappings.
- (iv) intuitionistic fuzzy generalized homeomorphism (IFG homeomorphism in short) if  $f$  and  $f^{-1}$  are IFG continuous mappings.
- (v) intuitionistic fuzzy generalized semi homeomorphism (IFGS homeomorphism in short) if  $f$  and  $f^{-1}$  are IFGS continuous mappings.

(vi) intuitionistic fuzzy alpha generalized homeomorphism (IF $\alpha$ G homeomorphism in short) if  $f$  and  $f^{-1}$  are IF $\alpha$ G continuous mappings.

**Definition 2.15:**[9] An IFTS  $(X, \tau)$  is said to be an intuitionistic fuzzy  $\pi T_{1/2}$  (in short IF $\pi T_{1/2}$ ) space if every IF $\pi$ GCS in  $(X, \tau)$  is an IFCS in  $(X, \tau)$ .

**Definition 2.16:**[9] An IFTS  $(X, \tau)$  is said to be an intuitionistic fuzzy  $\pi g T_{1/2}$  (in short IF $\pi g T_{1/2}$ ) space if every IF $\pi$ GCS in  $(X, \tau)$  is an IFGCS in  $(X, \tau)$ .

### 3. INTUITIONISTIC FUZZY $\pi$ GENERALIZED SEMI HOMEOMORPHISMS

In this section, we introduce intuitionistic fuzzy  $\pi$  generalized semi homeomorphism and study some of its properties.

**Definition 3.1:** A bijection mapping  $f : (X, \tau) \rightarrow (Y, \sigma)$  is called an intuitionistic fuzzy  $\pi$  generalized semi homeomorphism (briefly IF $\pi$ GS homeomorphism) if  $f$  and  $f^{-1}$  are IF $\pi$ GS continuous mappings.

We denote the family of all IF  $\pi$  GS homeomorphisms of an IFTS  $(X, \tau)$  onto itself by **IF $\pi$ GS-h $(X, \tau)$** .

**Example 3.2:** Let  $X = \{a, b\}$ ,  $Y = \{u, v\}$  and  $G_1 = \langle x, (0.12, 0.12), (0.54, 0.63) \rangle$ ,  $G_2 = \langle y, (0.33, 0.61), (0.31, 0.12) \rangle$ . Then,  $\tau = \{0_-, G_1, 1_-\}$  and  $\sigma = \{0_-, G_2, 1_-\}$  are IFTs on  $X$  and  $Y$  respectively. Define a bijection mapping  $f : (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = u$  and  $f(b) = v$ . Then  $f$  is an IF $\pi$ GS continuous mapping and  $f^{-1}$  is also an IF $\pi$ GS continuous mapping. Therefore,  $f$  is an IF  $\pi$  GS homeomorphism.

**Proposition 3.3:** Every IF homeomorphism is an IF $\pi$ GS homeomorphism.

**Proof:** Let  $f : (X, \tau) \rightarrow (Y, \sigma)$  be an IF homeomorphism. Then  $f$  and  $f^{-1}$  are IF continuous and  $f$  is bijection. Since every IF continuous mapping is IF  $\pi$  GS continuous mapping, we have  $f$  and  $f^{-1}$  are IF $\pi$ GS continuous mappings. Therefore,  $f$  is IF $\pi$ GS homeomorphism.

The converse of the above proposition need not be true as seen from the following example.

**Example 3.4:** Let  $X = \{a, b\}$ ,  $Y = \{u, v\}$  and  $G_1 = \langle x, (0.31, 0.21), (0.62, 0.71) \rangle$ ,  $G_2 = \langle y, (0.51, 0.41), (0.4, 0.21) \rangle$ . Then,  $\tau = \{0_-, G_1, 1_-\}$  and  $\sigma = \{0_-, G_2, 1_-\}$  are IFTs on  $X$  and  $Y$  respectively. Define a bijection mapping  $f : (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = u$  and  $f(b) = v$ . Then,  $f$  is an IF $\pi$ GS homeomorphism but not an IF homeomorphism since  $f$  and  $f^{-1}$  are not IF continuous mappings.

**Proposition 3.5 :** Every IFS homeomorphism is an IF $\pi$ GS homeomorphism but not conversely.

**Proof:** Let  $f : (X, \tau) \rightarrow (Y, \sigma)$  be an IFS homeomorphism. Then,  $f$  and  $f^{-1}$  are IFS continuous mappings. Since every IFS continuous mapping is an IF $\pi$ GS continuous mapping,  $f$  and  $f^{-1}$  are IF $\pi$ GS continuous mappings. Therefore,  $f$  is an IF $\pi$ GS homeomorphism.

**Example 3.6 :** Let  $X = \{a, b\}$ ,  $Y = \{u, v\}$  and  $G_1 = \langle x, (0.421, 0.31), (0.43, 0.421) \rangle$ ,  $G_2 = \langle y, (0.123, 0.12), (0.61, 0.723) \rangle$ . Then,  $\tau = \{0_-, G_1, 1_-\}$  and  $\sigma = \{0_-, G_2, 1_-\}$  are IFTs on  $X$  and  $Y$  respectively. Define a mapping  $f : (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = u$  and  $f(b) = v$ . Then,  $f$  is an

IF $\pi$ GS homeomorphism. For an IFCS  $A = \langle y, (0.61, 0.723), (0.123, 0.12) \rangle$  in  $(Y, \sigma)$ ,  $f^{-1}(A) = \langle x, (0.61, 0.723), (0.123, 0.12) \rangle$  is not an IFSCS in  $(X, \tau)$ . This implies  $f$  is not an IFS continuous mapping. Hence  $f$  is not an IFS homeomorphism.

**Proposition 3.7 :** Every IFGS homeomorphism is an IF $\pi$ GS homeomorphism.

**Proof:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be an IFGS homeomorphism. Then  $f$  and  $f^{-1}$  are IFGS continuous mappings. Since every IFGS continuous mapping is an IF $\pi$ GS continuous mapping,  $f$  and  $f^{-1}$  are IF $\pi$ GS continuous mappings. Therefore,  $f$  is an IF $\pi$ GS homeomorphism.

The converse of the above proposition need not be true as seen from the following example.

**Example 3.8 :** Let  $X = \{ a, b \}$ ,  $Y = \{ u, v \}$  and  $G_1 = \langle x, (0, 0.91), (0.53, 0.12) \rangle$ ,  $G_2 = \langle y, (0.7, 0.7), (0, 0.31) \rangle$ . Then,  $\tau = \{0_-, G_1, 1_-\}$  and  $\sigma = \{0_-, G_2, 1_-\}$  are IFTs on  $X$  and  $Y$  respectively. Define a mapping  $f : (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = u$  and  $f(b) = v$ . Then,  $f$  is an IF $\pi$ GS homeomorphism. For an IFCS  $A = \langle y, (0, 0.31), (0.7, 0.7) \rangle$  in  $(Y, \sigma)$ ,  $f^{-1}(A) = \langle x, (0, 0.31), (0.7, 0.7) \rangle$  is not an IFGSCS in  $(X, \tau)$ . This implies that  $f$  is not an IFGS continuous mapping. Hence  $f$  is not an IFGS homeomorphism.

**Proposition 3.9 :** Every IF $\alpha$  homeomorphism is an IF $\pi$ GS homeomorphism but the converse need not true.

**Proof:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be an IF $\alpha$  homeomorphism. Then  $f$  and  $f^{-1}$  are IF $\alpha$  continuous mappings. Since every

IF $\alpha$  continuous mapping is an IF $\pi$ GS continuous mapping,  $f$  and  $f^{-1}$  are IF $\pi$ GS continuous mappings. Therefore,  $f$  is an IF $\pi$ GS homeomorphism.

**Example 3.10 :** Let  $X = \{ a, b \}$ ,  $Y = \{ u, v \}$  and  $G_1 = \langle x, (0.543, 0.421), (0.52, 0.632) \rangle$ ,  $G_2 = \langle y, (0.212, 0.21), (0.7, 0.842) \rangle$ . Then,  $\tau = \{0_-, G_1, 1_-\}$  and  $\sigma = \{0_-, G_2, 1_-\}$  are IFTs on  $X$  and  $Y$  respectively. Define a mapping  $f: (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = u$  and  $f(b) = v$ . Then,  $f$  is an IF $\pi$ GS homeomorphism. For an IFCS  $A = \langle y, (0.7, 0.842), (0.212, 0.21) \rangle$  in  $(Y, \sigma)$ . Then  $f^{-1}(A) = \langle x, (0.7, 0.842), (0.212, 0.21) \rangle$  is not an IF $\alpha$ CS in  $(X, \tau)$ . This implies that  $f$  is not an IF $\alpha$  continuous mapping. Hence  $f$  is not an IF $\alpha$  homeomorphism.

**Proposition 3.11:** Every IF $\alpha$ G homeomorphism is an IF $\pi$ GS homeomorphism but not conversely.

**Proof:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be an IF $\alpha$ G homeomorphism. Then  $f$  and  $f^{-1}$  are IF $\alpha$ G continuous mappings. Since every IF $\alpha$ G continuous mapping is an IF $\pi$ GS continuous mapping,  $f$  and  $f^{-1}$  are IF $\pi$ GS continuous mappings. Therefore,  $f$  is an IF $\pi$ GS homeomorphism.

**Example 3.12:** Let  $X = \{ a, b \}$ ,  $Y = \{ u, v \}$  and  $G_1 = \langle x, (0.21, 0.32), (0.41, 0.52) \rangle$ ,  $G_2 = \langle y, (0.51, 0.612), (0.12, 0) \rangle$ . Then  $\tau = \{0_-, G_1, 1_-\}$  and  $\sigma = \{0_-, G_2, 1_-\}$  are IFTs on  $X$  and  $Y$  respectively. Define a mapping  $f : (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = u$  and  $f(b) = v$ . Then  $f$  is an IF $\pi$ GS homeomorphism. For an IFCS  $A = \langle y, (0.12, 0), (0.51, 0.612) \rangle$  in  $(Y, \sigma)$ . Then  $f^{-1}(A) = \langle x, (0.12, 0), (0.51, 0.612) \rangle$  is not an IF $\alpha$ GCS in  $(X, \tau)$ . This implies that  $f$

is not an IF $\alpha$ G continuous mapping. Hence  $f$  is not an IF $\alpha$ G homeomorphism.

From the above discussions and known results we have the following diagram.

**Theorem 3.13:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be an IF $\pi$ GS homeomorphism. Then  $f$  is an IF homeomorphism if  $(X, \tau)$  and  $(Y, \sigma)$  are IF $\pi$ T $_{1/2}$  space.

**Proof:** Let  $B$  be an IFCS in  $(Y, \sigma)$ . Since  $f$  is an IF $\pi$ GS homeomorphism,  $f^{-1}(B)$  is an IF $\pi$ GSCS in  $(X, \tau)$ . Since  $(X, \tau)$  is an IF $\pi$ T $_{1/2}$  space,  $f^{-1}(B)$  is an IFCS in  $(X, \tau)$ . Hence  $f$  is an IF continuous mapping. Also,  $f^{-1}: (Y, \sigma) \rightarrow (X, \tau)$  is a IF $\pi$ GS continuous mapping. Let  $A$  be an IFCS in  $(X, \tau)$ . Then,  $(f^{-1})^{-1}(A) = f(A)$  is an IF $\pi$ GSCS in  $(Y, \sigma)$ . Since  $(Y, \sigma)$  is an IF $\pi$ T $_{1/2}$  space,  $f(A)$  is an IFCS in  $(Y, \sigma)$ . Hence  $f^{-1}$  is an IF continuous mapping. Therefore, the mapping  $f$  is an IF homeomorphism.

**Theorem 3.14:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be an IF $\pi$ GS homeomorphism. Then  $f$  is an IFG homeomorphism if  $(X, \tau)$  and  $(Y, \sigma)$  are IF $\pi$ T $_{1/2}$  space.

**Proof:** Let  $B$  be an IFCS in  $(Y, \sigma)$ . Since  $f$  is an IF $\pi$ GS homeomorphism,  $f^{-1}(B)$  is an IF $\pi$ GSCS in  $(X, \tau)$ . Since  $(X, \tau)$  is an IF $\pi$ T $_{1/2}$  space,  $f^{-1}(B)$  is an IFCS in  $(X, \tau)$ . Hence  $f$  is an IFG continuous mapping. Also,  $f^{-1}: (Y, \sigma) \rightarrow (X, \tau)$  is a IF $\pi$ GS continuous mapping. Let  $A$  be an IFCS in  $(X, \tau)$ . Then,  $(f^{-1})^{-1}(A) = f(A)$  is an IF $\pi$ GSCS in  $(Y, \sigma)$ . Since  $(Y, \sigma)$  is an IF $\pi$ T $_{1/2}$  space,  $f(A)$  is an IFCS in  $(Y, \sigma)$ . Hence  $f^{-1}$  is an IFG continuous mapping. Therefore, the mapping  $f$  is an IFG homeomorphism.

**Theorem 3.15:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a bijective mapping. If  $f$  is an IF $\pi$ GS continuous mapping, then the following are equivalent.

- (i)  $f$  is an IF $\pi$ GS closed mapping.
- (ii)  $f$  is an IF $\pi$ GS open mapping.
- (iii)  $f$  is an IF $\pi$ GS homeomorphism.

**Proof:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a bijective mapping and  $f$  be an IF $\pi$ GS continuous mapping.

(i)  $\Rightarrow$  (ii): let  $f$  be an IF $\pi$ GS closed mapping. This implies that  $f^{-1}: (Y, \sigma) \rightarrow (X, \tau)$  is IF $\pi$ GS continuous mapping. Since every IFOS in  $(X, \tau)$  is an IF $\pi$ GSOS in  $(Y, \sigma)$ . Hence  $f^{-1}$  is an IF $\pi$ GS open mapping.

(ii)  $\Rightarrow$  (iii): let  $f$  be an IF $\pi$ GS open mapping. This implies that  $f^{-1}: (Y, \sigma) \rightarrow (X, \tau)$  is IF $\pi$ GS continuous mapping. Hence  $f$  and  $f^{-1}$  are IF $\pi$ GS continuous mappings. Therefore,  $f$  is an IF $\pi$ GS homeomorphism.

(iii)  $\Rightarrow$  (i): Let  $f$  is an IF $\pi$ GS homeomorphism. Then,  $f$  and  $f^{-1}$  are IF $\pi$ GS continuous mappings. Since every

IFCS in  $(X, \tau)$  is an IF $\pi$ GSCS in  $(Y, \sigma)$ ,  $f$  is an IF $\pi$ GS closed mapping.

**Remark 3.16:** The composition of two IF  $\pi$  GS homeomorphisms need not be an IF  $\pi$  GS homeomorphism in general. This can be shown from the following example.

**Example 3.17:** Let  $X = \{a, b\}$ ,  $Y = \{c, d\}$  and  $Z = \{u, v\}$ . Let  $G_1 = \langle x, (0.81, 0.612), (0.221, 0.432) \rangle$ ,  $G_2 = \langle y, (0.61, 0.12), (0.42, 0.31) \rangle$ ,  $G_3 = \langle z, (0.21, 0.41), (0.51, 0.41) \rangle$ ,  $G_4 = \langle z, (0.11, 0.31), (0.31, 0.41) \rangle$ ,  $G_5 = \langle z, (0.11, 0.31), (0.51, 0.41) \rangle$ ,  $G_6 = \langle z, (0.21, 0.41), (0.31, 0.41) \rangle$ , and  $G_7 = \langle z, (0.41, 0.41), (0.31, 0.41) \rangle$ . Then  $\tau = \{0_-, G_1, 1_-\}$ ,  $\sigma = \{0_-, G_2, 1_-\}$  and  $\eta = \{0_-, G_3, G_4, G_5, G_6, G_7, 1_-\}$  are IFTs on  $(X, \tau)$ ,  $(Y, \sigma)$  and  $(Z, \eta)$  respectively. Define bijection mapping  $f : (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = c$ ,  $f(b) = d$  and  $g : (Y, \sigma) \rightarrow (Z, \eta)$  by  $f(c) = u$ ,  $f(d) = v$ . Then,  $f$  and  $f^{-1}$  are IF $\pi$ GS continuous mappings. Also  $g$  and  $g^{-1}$  are IF $\pi$ GS continuous mappings. Hence  $f$  and  $g$  are IF $\pi$ GS homeomorphisms. But the composition  $g \circ f : (X, \tau) \rightarrow (Z, \eta)$  is not an IF $\pi$ GS homeomorphism since  $g \circ f$  is not an IF $\pi$ GS continuous mapping.

#### 4. INTUITIONISTIC FUZZY I $\pi$ GENERALIZED SEMI HOMEOMORPHISMS

**Definition 4.1:** A bijection mapping  $f : (X, \tau) \rightarrow (Y, \sigma)$  is called an intuitionistic fuzzy  $i \pi$  generalized semi homeomorphism (IFi $\pi$ GS homeomorphism in short) if  $f$  and  $f^{-1}$  are IF $\pi$ GS irresolute mappings.

We denote the family of all IFi  $\pi$  GS-homeomorphism of a topological space  $(X, \tau)$  onto itself by IFi $\pi$ GS- $h(X, \tau)$ .

**Theorem 4.2:** Every IFi  $\pi$  GS homeomorphism is an IF $\pi$ GS homeomorphism but not conversely.

**Proof:** Let  $f : (X, \tau) \rightarrow (Y, \sigma)$  be an IFi  $\pi$  GS homeomorphism. Then,  $f$  and  $f^{-1}$  are IF $\pi$ GS irresolute mappings. Since every IF $\pi$ GS irresolute mapping is an IF $\pi$ GS continuous mapping. Therefore,  $f$  and  $f^{-1}$  are IF $\pi$ GS continuous mappings and hence  $f$  is an IF $\pi$ GS homeomorphism.

**Example 4.3:** Let  $X = \{a, b\}$ ,  $Y = \{u, v\}$  and  $G_1 = \langle x, (0.21, 0.41), (0.51, 0.41) \rangle$ ,  $G_2 = \langle x, (0.11, 0.31), (0.31, 0.41) \rangle$ ,  $G_3 = \langle x, (0.11, 0.31), (0.51, 0.41) \rangle$ ,  $G_4 = \langle x, (0.21, 0.41), (0.31, 0.41) \rangle$ ,  $G_5 = \langle x, (0.41, 0.41), (0.31, 0.41) \rangle$  and  $G_6 = \langle y, (0.21, 0.11), (0.41, 0.51) \rangle$ . Then  $\tau = \{0_-, G_1, G_2, G_3, G_4, G_5, 1_-\}$  and  $\sigma = \{0_-, G_6, 1_-\}$  are IFTs on  $X$  and  $Y$  respectively. Define bijection mapping  $f : (X, \tau) \rightarrow (Y, \sigma)$  by  $f(a) = u$  and  $f(b) = v$ . Then,  $f$  is an IF  $\pi$  GS homeomorphism. But  $f$  is not an IFi  $\pi$  GS homeomorphism. For an IFS  $G = \langle y, (0, 0.3), (0.5, 0.4) \rangle$  in  $(Y, \sigma)$ ,  $G$  is an IF $\pi$ GSCS in  $(Y, \sigma)$ , but  $f^{-1}(G)$  is not an IF $\pi$ GSCS in  $(X, \tau)$  and therefore  $f$  is not an IF $\pi$ GS irresolute mapping.

**Theorem 4.4:** If  $f : (X, \tau) \rightarrow (Y, \sigma)$  is an IFi $\pi$ GS homeomorphism, then,  $\pi\text{gscl}(f^{-1}(B)) = f^{-1}(\pi\text{gscl}(B))$  for every IFS  $B$  in  $(Y, \sigma)$ .

**Proof:** Since  $f$  is an IFi $\pi$ GS homeomorphism,  $f : (X, \tau) \rightarrow (Y, \sigma)$  is an IF $\pi$ GS irresolute mapping. Consider an

IFS  $B$  in  $(Y, \sigma)$ . Clearly,  $\pi\text{gscl}(B)$  is an  $\text{IF}\pi\text{GSCS}$  in  $(Y, \sigma)$ . Since  $f$  is an  $\text{IF}\pi\text{GS}$  irresolute mapping,  $f^{-1}(\pi\text{gscl}(B))$  is an  $\text{IF}\pi\text{GSCS}$  in  $(X, \tau)$ . Since  $f^{-1}(B) \subseteq f^{-1}(\pi\text{gscl}(B))$ ,  $\pi\text{gscl}(f^{-1}(B)) \subseteq \pi\text{gscl}(f^{-1}(\pi\text{gscl}(B))) = f^{-1}(\pi\text{gscl}(B))$ . This implies that  $\pi\text{gscl}(f^{-1}(B)) \subseteq f^{-1}(\pi\text{gscl}(B))$ . Since  $f$  is an  $\text{IF}\pi\text{GS}$  homeomorphism,  $f^{-1}: (Y, \sigma) \rightarrow (X, \tau)$  is an  $\text{IF}\pi\text{GS}$  irresolute mapping. Consider an IFS  $f^{-1}(B)$  in  $(X, \tau)$ . Clearly,  $\pi\text{gscl}(f^{-1}(B))$  is an  $\text{IF}\pi\text{GSCS}$  in  $(X, \tau)$ . This implies that  $(f^{-1})^{-1}(\pi\text{gscl}(f^{-1}(B))) = f(\pi\text{gscl}(f^{-1}(B)))$  is an  $\text{IF}\pi\text{GSCS}$  in  $(Y, \sigma)$ . Clearly,  $B = (f^{-1})^{-1}(f^{-1}(B)) \subseteq (f^{-1})^{-1}(\pi\text{gscl}(f^{-1}(B))) = f(\pi\text{gscl}(f^{-1}(B)))$ . Therefore,  $\pi\text{gscl}(B) \subseteq \pi\text{gscl}(f(\pi\text{gscl}(f^{-1}(B)))) = f(\pi\text{gscl}(f^{-1}(B)))$ , since  $f^{-1}$  is an  $\text{IF}\pi\text{GS}$  irresolute mapping. Hence  $f^{-1}(\pi\text{gscl}(B)) \subseteq f^{-1}(f(\pi\text{gscl}(f^{-1}(B)))) = \pi\text{gscl}(f^{-1}(B))$ . Therefore,  $f^{-1}(\pi\text{gscl}(B)) \subseteq \pi\text{gscl}(f^{-1}(B))$ . This implies that  $\pi\text{gscl}(f^{-1}(B)) = f^{-1}(\pi\text{gscl}(B))$ .

**Corollary 4.5:** If  $f: (X, \tau) \rightarrow (Y, \sigma)$  is an  $\text{IF}\pi\text{GS}$  homeomorphism, then  $\pi\text{gscl}(f(B)) = f(\pi\text{gscl}(B))$  for every IFS  $B$  in  $(X, \tau)$ .

**Proof:** Since  $f$  is an  $\text{IF}\pi\text{GS}$  homeomorphism,  $f^{-1}$  is an  $\text{IF}\pi\text{GS}$  homeomorphism. Let  $B$  be an IFS in  $(X, \tau)$ . By Theorem 6.3.4,  $\pi\text{gscl}(f(B)) = f(\pi\text{gscl}(B))$  for every IFS  $B$  in  $(X, \tau)$ .

**Corollary 4.6:** If  $f: (X, \tau) \rightarrow (Y, \sigma)$  is an  $\text{IF}\pi\text{GS}$  homeomorphism, then  $f(\pi\text{gsint}(B)) = \pi\text{gsint}(f(B))$  for every IFS  $B$  in  $(X, \tau)$ .

**Proof :** For any IFS  $B$  in  $(X, \tau)$ ,  $\pi\text{gsint}(B) = (\pi\text{gscl}(B^c))^c$ . By Corollary 6.3.5,  $f(\pi\text{gsint}(B)) = f((\pi\text{gscl}(B^c))^c) = (f(\pi\text{gscl}(B^c)))^c = (\pi\text{gscl}(f(B^c)))^c$ . This implies that  $f(\pi\text{gsint}(B)) = (\pi\text{gscl}(f(B)))^c = \pi\text{gsint}(f(B))$ .

**Corollary 4.7:** If  $f: (X, \tau) \rightarrow (Y, \sigma)$  is an  $\text{IF}\pi\text{GS}$  homeomorphism, then  $f^{-1}(\text{sint}(B)) = \text{sint}(f^{-1}(B))$  for every IFS  $B$  in  $(X, \tau)$ .

**Proof :** Since  $f^{-1}: (Y, \sigma) \rightarrow (X, \tau)$  is also an  $\text{IF}\pi\text{GS}$  homeomorphism, the proof follows from Corollary 4.6.

**Proposition 4.8:** If  $f: (X, \tau) \rightarrow (Y, \sigma)$  and  $g: (Y, \sigma) \rightarrow (Z, \eta)$  are  $\text{IF}\pi\text{GS}$  homeomorphisms then their composition  $g \circ f: (X, \tau) \rightarrow (Z, \eta)$  is also an  $\text{IF}\pi\text{GS}$  homeomorphism.

**Proof:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  and  $g: (Y, \sigma) \rightarrow (Z, \eta)$  be any two  $\text{IF}\pi\text{GS}$  homeomorphisms. Therefore,  $f, f^{-1}, g$  and  $g^{-1}$  are  $\text{IF}\pi\text{GS}$  irresolute mappings. By Theorem,  $g \circ f$  and  $(g \circ f)^{-1} = f^{-1} \circ g^{-1}$  are  $\text{IF}\pi\text{GS}$  irresolute mappings and  $(g \circ f)$  is an  $\text{IF}\pi\text{GS}$  homeomorphism.

**Proposition 4.9:** The set  $\text{IF}\pi\text{GS-}h(X, \tau)$  is a group under the composition of maps.

**Proof :** Define a binary operation  $*$  :  $\text{IF}\pi\text{GS-}h(X, \tau) \times \text{IF}\pi\text{GS-}h(X, \tau) \rightarrow \text{IF}\pi\text{GS-}h(X, \tau)$  by  $f * g = g \circ f$  for all  $f, g \in \text{IF}\pi\text{GS-}h(X, \tau)$  and  $\circ$  is the usual operation of composition of maps.

(i) **Closure Property:** Let  $f \in \text{IF}\pi\text{GS-}h(X, \tau)$  and  $g \in \text{IF}\pi\text{GS-}h(X, \tau)$ . By Theorem 6.3.8,  $g \circ f \in \text{IF}\pi\text{GS-}h(X, \tau)$ .

(ii) **Associative property :** We know that the

composition of mappings is associative.

(iii) **Existence of identity** : The identity mappings  $I$  :

$(X, \tau) \rightarrow (X, \tau)$  belonging to  $\text{IFi}\pi\text{GS-}h(X, \tau)$

serves as the identity element.

(iv) **Existence of inverse** : If  $f \in \text{IFi}\pi\text{GS-}h(X, \tau)$ ,

then  $f^{-1} \in \text{IFi}\pi\text{GS-}h(X, \tau)$  such that

$f^{-1} * f = f \circ f^{-1} = I$ . Therefore, inverse exists

for each element of  $\text{IFi}\pi\text{GS-}h(X, \tau)$ .

Therefore,  $(\text{IFi}\pi\text{GS-}h(X, \tau), \circ)$  is a group under the operation of composition of maps.

**Theorem 4.10:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a  $\text{IFi}\pi\text{GS}$  homeomorphism. Then  $f$  induces an isomorphism from the group  $\text{IFi}\pi\text{GS-}h(X, \tau)$  onto the group  $\text{IFi}\pi\text{GS-}h(Y, \sigma)$ .

**Proof** : Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a  $\text{IFi}\pi\text{GS}$  homeomorphism. We define a map  $\theta_f: \text{IFi}\pi\text{GS-}h(X, \tau) \rightarrow \text{IFi}\pi\text{GS-}h(Y, \sigma)$ , by  $\theta_f(h): f \circ h \circ f^{-1}$  for every  $h \in \text{IFi}\pi\text{GS-}h(X, \tau)$ , using the mapping  $f$ .

Clearly, we have to prove that  $\theta_f$  is a homeomorphism.  $\theta_f(h_1 \circ h_2) = f \circ (h_1 \circ h_2) \circ f^{-1} = (f \circ h_1) \circ (h_2 \circ f^{-1}) = (f \circ h_1) \circ (f^{-1} \circ f) \circ (h_2 \circ f^{-1}) = (f \circ h_1 \circ f^{-1}) \circ (f \circ h_2 \circ f^{-1}) = \theta_f(h_1) \circ \theta_f(h_2)$ , for all  $h_1, h_2 \in \text{IFi}\pi\text{GS-}$

$h(X, \tau)$ . Therefore,  $\theta_f$  is a homeomorphism. Hence  $f$  induces an isomorphism from the group  $\text{IFi}\pi\text{GS-}h(X, \tau)$  onto the group  $\text{IFi}\pi\text{GS-}h(Y, \sigma)$ .
