# Alternative Methods to Prove Theorem of Intersection of Two Subspace of a Vector Space 

Arpit Mishra<br>Department of Mathematics<br>Hemvati Nandan Bahuguna Garhwal University, Srinagar (Garhwal), Uttarakhand-246174<br>(A Central University)

#### Abstract

In this paper, we study about alternative methods by which we can proof the theorem, Intersection of any two subspaces of a vector space $V(F)$ is again a subspace of $V(F)$. We all are familiar with the methods of proving the given theorems mentioned in books as reference books but there are also other methods by which we can prove the theorem using some theorems directly as statements.

Keywords - Vector Space, Vector-Subspace, Necessary and Sufficient Condition of Vector Subspace to be a subspace, Linear Sum of Two Subspace of a Vector space.

## 1. INTRODUCTION

We have already studied out the two important basic algebraic structures 'groups' and 'rings'. In groups, we have studied the algebraic system with one binary operation and in the rings, integral domain and fields we have studied the algebraic system with two binary operations. Now we shall consider another important algebraic system known as linear vector space or simply vector space upon which the whole of linear algebra is based.

### 1.1. Vector Space :-

If ( $\mathrm{F},+$, ) is a field and V is a non-empty set of vectors, then an algebraic structure $\mathrm{V}(\mathrm{F})$ is called a vector space if it satisfy the following conditions :
1.1.1. V is an abelian additive group of vectors.
1.1.2. $\forall \mathrm{a} \varepsilon \mathrm{F}$ and $\alpha \varepsilon \mathrm{V}(\mathrm{F})=>\mathrm{a} \alpha \varepsilon \mathrm{V}(\mathrm{F})$ i.e. V is closed for the scalar multiplication.
1.1.3. $\forall \mathrm{a} \varepsilon \mathrm{F}$ and $\alpha, \beta \varepsilon \mathrm{V}(\mathrm{F})$, the following four laws of scalar multiplication are satisfied :
1.1.3.1 $\quad a^{\prime}(\alpha+\beta)=a^{\prime} \alpha+a^{\prime} \beta$
1.1.3.2. $(a+b)^{\prime} \alpha=a^{\prime} \alpha+b \cdot \alpha$
1.1.3.3. $a^{\prime}\left(b^{\prime} \alpha\right)=\left(a^{\prime} b\right)^{\prime} \alpha$
1.1.3.4. $1^{\prime} \alpha=\alpha, 1$ is the unit element of $F$.

### 1.2. Vector-Subspace :-

Let $\mathrm{V}(\mathrm{F})$ be a vector space and W is a non-empty subset of $\mathrm{V}(\mathrm{F})$, then W is called a sub-space of $\mathrm{V}(\mathrm{F})$ if w is itself a vector space under the same operations that defined for $\mathrm{V}(\mathrm{F})$.

### 1.3. Necessary and Sufficient Condition of Vector Subspace to be a subspace :- <br> 1.3.1.W is closed under vector addition in $\mathrm{V}(\mathrm{F})$. <br> 1.3.2. W is closed under scalar multiplication in $\mathrm{V}(\mathrm{F})$.

### 1.4.Linear Sum of Two Subspace of a Vector space :-

Let $V(F)$ is a vector space and $W_{1}, W_{2}$ are two sub-space of $V(F)$, then the linear sum of $W_{1}$ and $W_{2}$ is denoted by $\mathrm{W}_{1}+\mathrm{W}_{2}$ and defined as :

$$
\mathrm{W}_{1}+\mathrm{W}_{2}=\left\{\left(\mathrm{w}_{1}+\mathrm{w}_{2}\right): \mathrm{w}_{1} \varepsilon \mathrm{~W}_{1} \text { and } \mathrm{w}_{2} \varepsilon \mathrm{~W}_{2}\right\}
$$

## 2. ALTERNATIVE METHODS

### 2.1 METHOD 1

Let $W_{1}$ and $W_{2}$ be two subspaces of a vector space $\mathrm{V}(\mathrm{F})$, then we have to show that $\mathrm{W}_{1} \cap \mathrm{~W}_{2}$ is also a subspace of $V(F)$.

Since $0 \varepsilon \mathrm{~W}_{1}$ and $0 \varepsilon \mathrm{~W}_{2}=>0 \varepsilon \mathrm{~W}_{1} \cap \mathrm{~W}_{2}$
Therefore, $\mathrm{W}_{1} \cap \mathrm{~W}_{2}$ is not an empty i.e. $\mathrm{W}_{1} \cap \mathrm{~W}_{2} \neq \Phi$.
Let $\mathrm{a}, \mathrm{b} \varepsilon \mathrm{F}$ and $\alpha, \beta \varepsilon \mathrm{W}_{1} \cap \mathrm{~W}_{2}$.
Now, $\alpha \varepsilon \mathrm{W}_{1} \cap \mathrm{~W}_{2}=>\alpha \varepsilon \mathrm{W}_{1}$ and $\alpha \varepsilon \mathrm{W}_{2}$
$\beta \varepsilon \mathrm{W}_{1} \cap \mathrm{~W}_{2}=>\beta \varepsilon \mathrm{W}_{1}$ and $\beta \varepsilon \mathrm{W}_{2}$.
Again , $\alpha, \beta \varepsilon \mathrm{W}_{1}$ and $\mathrm{a}, \mathrm{b} \varepsilon \mathrm{F}=>\mathrm{a} \alpha+\mathrm{b} \beta \varepsilon \mathrm{W}_{1},\left(\mathrm{~W}_{1}\right.$ is a subspace )
Also, $\alpha, \beta \varepsilon \mathrm{W}_{2}$ and $\mathrm{a}, \mathrm{b} \varepsilon \mathrm{F} \Rightarrow \mathrm{a} \alpha+\mathrm{b} \beta \varepsilon \mathrm{W}_{2} .\left(\mathrm{W}_{2}\right.$ is a subspace )
Hence, we see that $\mathrm{a} \alpha+\mathrm{b} \beta$ is common element of $\mathrm{W}_{1}$ and $\mathrm{W}_{2}$.
Therefore, $\mathrm{a} \alpha+\mathrm{b} \beta \varepsilon \mathrm{W}_{1} \cap \mathrm{~W}_{2}$.
Thus, $\alpha, \beta \varepsilon \mathrm{W}_{1} \cap \mathrm{~W}_{2}$ and $\mathrm{a}, \mathrm{b} \varepsilon \mathrm{F}=>\mathrm{a} \alpha+\mathrm{b} \beta \varepsilon \mathrm{W}_{1} \cap \mathrm{~W}_{2}$.
By using theorem,
The non-empty subset $W$ of vector space $V(F)$ is a subspace of $V(F)$ iff
I. $\quad 0 \varepsilon \mathrm{~W}(\mathrm{~V} \neq \Phi)$
II. $\quad \mathrm{a}, \mathrm{b} \varepsilon \mathrm{F}$ and $\alpha, \beta \varepsilon \mathrm{W}=>\mathrm{a} \alpha+\mathrm{b} \beta \varepsilon \mathrm{W}$.

Thus, $W_{1} \cap W_{2}$ is a subspace of a vector space $V(F)$.

### 1.2. METHOD 2

Let $\alpha, \beta \varepsilon \mathrm{W}_{1} \cap \mathrm{~W}_{2}=>\alpha, \beta \varepsilon \mathrm{W}_{1}$ and $\alpha, \beta \varepsilon \mathrm{W}_{2}$.
$\Rightarrow \alpha+(-\beta) \varepsilon \mathrm{W}_{1}$ and $\alpha+(-\beta) \varepsilon \mathrm{W}_{2}$, (if $\beta \varepsilon \mathrm{W}_{1}$ and $\mathrm{W}_{2}=>-\beta \varepsilon \mathrm{W}_{1}$ and $\mathrm{W}_{2}$ )
$\Rightarrow \alpha+(-\beta)$ or $\alpha-\beta \varepsilon \mathrm{W}_{1} \cap \mathrm{~W}_{2}$.
Again, let a $\varepsilon \mathrm{F}$ and $\alpha \varepsilon \mathrm{W}_{1} \cap \mathrm{~W}_{2} \Rightarrow \mathrm{a} \varepsilon \mathrm{F}, \alpha \varepsilon \mathrm{W}_{1}$ and $\alpha \varepsilon \mathrm{W}_{2}$.
$\Rightarrow \mathrm{a} \alpha \varepsilon \mathrm{W}_{1}$ and $\mathrm{a} \alpha \varepsilon \mathrm{W}_{2,}\left(\mathrm{~W}_{1}\right.$ and $\mathrm{W}_{2}$ are subspaces of a vector space $\mathrm{V}(\mathrm{F})$ )
$\Rightarrow \mathrm{a} \alpha \varepsilon \mathrm{W}_{1} \cap \mathrm{~W}_{2}$.

Thus, $\mathrm{W}_{1} \cap \mathrm{~W}_{2}$ is closed under scalar multiplication.

By using theorem,
A non - empty subset W of a vector space $\mathrm{V}(\mathrm{F})$ is a subspace of $\mathrm{V}(\mathrm{F})$ iff
I. $\alpha, \beta \varepsilon \mathrm{W}=>\alpha-\beta \varepsilon \mathrm{W}$.
II. $\mathrm{a} \varepsilon \mathrm{F}, \alpha \varepsilon \mathrm{W}=>\mathrm{a} \alpha \varepsilon \mathrm{W}$.

Hence, $W_{1} \cap W_{2}$ is a subspace of a vector space $V(F)$.

### 1.3. METHOD 3

Firstly, let $\alpha, \beta \varepsilon \mathrm{W}_{1} \cap \mathrm{~W}_{2}=>\alpha, \beta \varepsilon \mathrm{W}_{1}$ and $\alpha, \beta \varepsilon \mathrm{W}_{2}$.
$\Rightarrow \alpha+\beta \varepsilon \mathrm{W}_{1}$ and $\alpha+\beta \varepsilon \mathrm{W}_{2}$
$\Rightarrow \alpha+\beta \varepsilon \mathrm{W}_{1} \cap \mathrm{~W}_{2}$.
Since, we know that $W_{1}$ and $W_{2}$ are subspaces of a vector space $V(F)$ then their linear sum be also a subspace of V(F)
i.e. $\mathrm{W}_{1}+\mathrm{W}_{2}$ is also a subspace.
$\Rightarrow \alpha+\beta \varepsilon \mathrm{W}_{1}+\mathrm{W}_{2}$.
Thus, $\mathrm{W}_{1} \cap \mathrm{~W}_{2}$ is closed under vector addition.
Secondly, let a $\varepsilon \mathrm{F}$ and $\alpha \varepsilon \mathrm{W}_{1} \cap \mathrm{~W}_{2}=>\mathrm{a} \varepsilon \mathrm{F}, \alpha \varepsilon \mathrm{W}_{1}$ and $\alpha \varepsilon \mathrm{W}_{2}$.
$\Rightarrow \mathrm{a} \alpha \varepsilon \mathrm{W}_{1}$ and $\mathrm{a} \alpha \varepsilon \mathrm{W}_{2}$,
$\Rightarrow \mathrm{a} \alpha \varepsilon \mathrm{W}_{1} \cap \mathrm{~W}_{2}$.
Since, we know that $W_{1}$ and $W_{2}$ are subspaces of a vector space $V(F)$ then their linear sum be also a subspace of $V(F)$.
i.e. $\mathrm{W}_{1}+\mathrm{W}_{2}$ is also a subspace.
$\Rightarrow \mathrm{a} \alpha \varepsilon \mathrm{W}_{1}+\mathrm{W}_{2}$.
Thus, $\mathrm{W}_{1} \cap \mathrm{~W}_{2}$ is closed under scalar multiplication.
By using theorem,
A non - empty subset $W$ of a vector space $V(F)$ is a subspace of $V(F)$ iff
I. $\quad \mathrm{W}$ is non- empty
II. $\quad W$ is closed under vector addition i.e. $\alpha, \beta \varepsilon W \Rightarrow \alpha+\beta \varepsilon W$.
III. $\quad W$ is closed under scalar multiplication i.e. $\mathrm{a} \alpha \varepsilon \mathrm{W} \forall \mathrm{a} \varepsilon \mathrm{F}$ and $\alpha \varepsilon \mathrm{W}$.

Thus, $W_{1} \cap W_{2}$ is a subspace of a vector space $V(F)$
