# Diameter and Travers ability of PAN Critical Graphs 

J. Suresh Kumar<br>Post-Graduate Department of Mathematics, N.S.S.Hindu College, Changanacherry, Kottayam Dist., Kerala, India-686102

#### Abstract

A pseudo-complete coloring of a graph $G$ is an assignment of colors to the vertices of $G$ such that for any two distinct colors, there existadjacent vertices having those colors. The maximum number of colors used in a pseudocomplete coloring of $G$ is called the pseudoachromatic number of G and is denoted by $\psi_{s}(G)$. A graph G is called edge critical if $\psi_{s}(G-$ $e)<\psi_{s}(G)$ for any edge e of G. A graph G is called vertex critical if $\psi_{s}(G-v)<. \psi_{s}(G)$ for every vertex v of G. These graphs are generally called as pseudoachromatic number critical graphs (shortly as PAN Critical graphs). In this paper, we investigate the properties of these critical graphs. Research supported by UGC-JRF.

AMS subject classification number: 05C70, 05CO5
Keywords: Pseudo-complete coloring, Pseudoachromatic number, k-edge critical graph, k vertex critical graph.

## 1. Introduction

By a graph we mean a finite undirected graph without loops, multiple edges and isolated vertices.

An assignment of colors to the vertices of a graph $G=(V, E)$ is called a proper coloring, if any two adjacent vertices receive distinct colors and is called a pseudo--complete coloring if for any two distinct colors, there exist adjacent vertices having those colors. A pseudo-complete proper coloring of $G$ is called a complete coloring of $G$.

The minimum number of colors used in a proper coloring of $G$ is called the chromatic number of $G$ and is denoted by $\mathrm{x}(\mathrm{G})$. The maximum number of colors used in a completecoloring of $G$ is called the achromatic number of G and is denoted $\mathrm{by}(\psi G)$ ) [6]. The maximum number of colors used in a pseudocomplete coloring of $G$ is called the achromatic number of G and is denoted by $\psi_{s}(G) .[4]$. Several bounds for these coloring parameters were obtained in [4, 5, 6, 7]. A graph which admits a pseudo-complete coloring by $k$ colors is called a $k$-pseudo complete colorable graph.

The concept of critical graphs with respect to chromatic number, was introduced by Dirac $[2,3]$ in a bid to settle the four color conjecture. In [1], Sureshkumar introduced the concepts of criticality in graphs with respect to pseudo-achromatic number and obtained
characterizations of edge critical graphs, critical cycles and critical paths. In this paper, we further investigate theproperties of these critical graphs such as degrees, degree sequences, diameter and traversibility.

## 2. PAN Critical Graphs

The graphs which are critical with respect to Pseudo-achromatic number are generally called as PAN-critical graphs. Formal definitions are as follows:
Definition 2.1. A graph $G$ is called k-edge critical if $\psi_{\mathrm{s}}(\mathrm{G})=k$ and $\psi_{\mathrm{s}}(\mathrm{G}-\mathrm{e})<\mathrm{k}$ for any edge e of $G$. A graph $G$ is called k-vertex critical if $\psi_{s}(G)=k$ and $\psi_{s}(G-v)<k$ for any vertex v of G .
Definition 2.2. Let $G$ be a graph and $v \in$ $\mathrm{V}(\mathrm{G})$ be a vertex of degree $d$. Let n be a positive integer less than $d$. Then an $n$-splitting of $v$ is the replacement of $v$ by a set of $n$ new pairwise independent vertices $\left\{u_{i}\right\}_{i=1}^{n}$ withdegu $u_{i}>1$, for all i, $\quad 1<\mathrm{i}<\mathrm{n}, \quad \sum_{\mathrm{i}=1}^{\mathrm{n}} \operatorname{deg}\left(\mathrm{u}_{\mathrm{i}}\right)=\mathrm{d} \quad$ and $\quad \mathrm{N}\left(\left\{\mathrm{u}_{\mathrm{i}}\right\}_{\mathrm{i}=1}^{\mathrm{n}}\right)=$ $\mathrm{N}(\mathrm{v})$, where for any subset S of $\mathrm{V}(\mathrm{G}), \mathrm{N}(\mathrm{S})$ means the set of all neighbors of vertices in $S$.

The following simple observations, which are quite useful later, follow directly from the definitions of critical graphs.
Proposition 2.3. A graph $G$ is $k$-edge critical if and only if G is k -pseudo-complete colorable and $|E(G)|=\binom{n}{2}$
Proposition 2.4. Any k-edge critical graph is k-vertex critical.
Proposition 2.5.If $G$ is a k-edge critical graph and II is the graph obtained from G by n -splitting a vertex of G . Then H is k-edge critical.
Proposition 2.6. Let $G$ be a k-edge critical graph and $H$ be the graph obtained from $G$ by identifying a pair of vertices, having same color with respect to a k-pseudo-complete coloring of G. Then H is k-edge critical.
Proposition 2.7.IfG is k-edge critical, then $\mathrm{G}+\mathrm{K}_{\mathrm{n}}$, is ( $\mathrm{n}+\mathrm{k}$ )-vertex critical
Proposition 2.8. Let $k$ be an odd integer.
Then, the cycle of order $\binom{k}{2}$ ) is k--edge critical.

## 3. Diameter and Traversibility

Theorem 3.1. Let $G$ be a k-edge critical graph with $G \neq K_{k}, k \geq 3$. Then, $3 \leq d(G) \leq$ $\binom{k}{2}$ and when $\mathrm{k} \quad$ is even, $3 \leq d(G) \leq\binom{ k}{2}$ -
$(k / 2)+1$, where $\mathrm{d}(\mathrm{G})$ denotes the diameter of G.

Proof.Suppose $d(G)=2$. Then any two vertices of $G$ are either adjacent or having a common neighbor. Since $G$ is k-edge critical, it follows that any $k$-pseudo-complete coloring of $G$ is a proper coloring of G . Thus, $\mathrm{G}=\mathrm{K}_{\mathrm{k}}$ which is a contradiction. Henced $(G)>3$. Also, $d(G) \leq$ $|E(G)| \leq\binom{ k}{2}$.

Suppose k is even. Since G is k-edge critical, it follows from Proposition 2.6 that the graph obtained from G by identifying all pairs of vertices having same color, with respect to any k-pseudo-complete coloring of G , is isomorphic to $\mathrm{K}_{\mathrm{k}}$ and a path in G corresponds to a trail of same length in $\mathrm{K}_{\mathrm{k}}$. Since the maximum length of a trail in $\mathrm{K}_{\mathrm{k}}$ is k $(\mathrm{k} / 2)+1, d(G) \leq\binom{ k}{2}-(k / 2)+1$
Theorem 3.2. Let $m$ and $n$ be two positive integers such that $3 \leq m \leq\binom{ n}{2}$ when n is odd and $3 \leq m \leq\binom{ n}{2}-(n / 2)+1$, when n is even. Thenthere exists n-edge critical graph $G$ with $\mathrm{d}(\mathrm{G})=\mathrm{m}$.
Proof.Case $1.3 \leq m \leq n$
Consider a path $\mathrm{P}_{\mathrm{n}}=(\mathrm{u} 1, \mathrm{u} 2, \ldots, \mathrm{u}$, ) on n vertices. For $1 \leq \mathrm{i} \leq \mathrm{n}-2$, take aset of $\mathrm{n}-\mathrm{i}-1$ pairwise independent vertices, $\left(\mathrm{w}_{\mathrm{i}, \mathrm{j}}\right)_{\mathrm{j}=1}^{\mathrm{n}-\mathrm{i}-1}$ and join each $w_{i, j}$ with $u_{j}$. Call the resulting graph as $G_{n}$. Then, $\quad \mathrm{f}: \mathrm{V}\left(\mathrm{G}_{\mathrm{n}}\right) \rightarrow\{1,2, \ldots \mathrm{n}\}$ defined $\quad \operatorname{byf}\left(\mathrm{u}_{\mathrm{i}}\right)=$ $\mathrm{i}, \mathrm{f}\left(\mathrm{w}_{\mathrm{i}, \mathrm{j}}\right)=\mathrm{i}+\mathrm{j}+1$ assigns an n-pseudo-complete coloring for $\mathrm{G}_{\mathrm{n}}$. Since $\left|E\left(G_{n}\right)\right|=\binom{n}{2}, \mathrm{G}_{\mathrm{n}}$ is n edge critical and $d\left(G_{n}\right)=n$

Now, for $2 \leq i \leq n-2$ and $1 \leq j \leq n-i+$ 1, remove each pendant vertex of the form $w_{i, j}$ from $\mathrm{G}_{\mathrm{n}}$ and join $w_{1, i-2}$ with $w_{1, i+j+1}$ by an edge, remove each pendant vertex of the form $w_{2, j}$ from $G_{n}$ and join $\mathrm{u}_{2}$ with $w_{1, j+1}$ by an edge and remove $\mathrm{u}_{\mathrm{n}}$ and join $w_{1, n-3}$ with $w_{1, n-2}$ by an edge. Call the resulting graph as $G_{n-1}$ Also, for $1 \leq k \leq$ $n-4$, let $G_{n-1-k}$ be the graph obtained from $G_{n-k}$ by removing the vertex $u_{n-k}$ and joining $w_{1, n-k-2}$ with $w_{1, n-k-3}$ by an edge. Clearly, $G_{n-1-k}$ is n-edge critical and $\mathrm{d}\left(G_{n-1-k}\right)$ $=\mathrm{n}-\mathbf{1}-k$ for each $\mathrm{k}, 0 \leq k \leq n-4$
Case $2 . n<m \leq\binom{ n}{2}$ and $n$ is odd.
Consider a path $P_{N+1}=\left(u_{1}, u_{2}, \ldots u_{N+1}\right)$, where $N=\binom{n}{2}$. Define a function $f: V\left(P_{N}\right) \rightarrow\{1,2, \ldots n\}$ by
$f\left(u_{i}\right)$
$=\left\{\begin{array}{c}n \quad \text { if } i \equiv 1(\bmod n) \\ \left(\left\{\frac{i}{n}\right\}+(-1)^{1+g(i)}\left[\frac{g(i)}{2}\right]\right)(\bmod n-1) \quad \text { otherwise }\end{array}\right.$
Where g is a functiong: $\{1,2, \ldots N+1\} \rightarrow\{1,2, \ldots n\}$ defined by $g(i)=(i-1)(\bmod n)$

It can be easily verified that $f$ assigns an $n$ -pseudo-complete coloring for $\mathrm{P}_{\mathrm{N}+1}$ Hence, by Proposition $2.3 \quad \mathrm{P}_{\mathrm{N}+1}$ is n -edge critical and $\mathrm{d}\left(\mathrm{P}_{\mathrm{N}+1}\right)=\mathrm{N}$.

Now, for each i with $N-1 \geq i \geq n+1$, consider the edges $\left\{u_{j} u_{j+1}\right\}_{j=i+1}^{N}$ and let $c_{j}=$ $\min \left\{f\left(u_{j}\right), f\left(u_{j+1}\right)\right\} \quad$ and $\quad c_{j}^{\prime}=$ $\max \left\{f\left(u_{j}\right), f\left(u_{j+1}\right)\right\}$. Then, for each $\mathrm{j}, i+1 \leq j \leq$ $N$, remove the vertex $u_{j+1}$ from $\mathrm{P}_{\mathrm{N}+1}$ and add a vertex, with $c_{j}^{\prime}$ as its f-value, and join it to $u_{c_{j}}$. The resulting graph $G_{i}$ is n-edge critical and $\mathrm{d}\left(\mathrm{G}_{\mathrm{i}}\right)=\mathrm{i}$.
Case 3. $n<m \leq\binom{ n}{2}-(n / 2)+1$ and n is even. Consider the complete graph $\mathrm{K}_{\mathrm{m}}$ with vertex set $\left\{v_{1}, v_{2}, \ldots v_{n}\right\}$. Let $F=\left\{v_{i} v_{(n / 2)+i} \in E\left(K_{n}\right): 1 \leq i \leq\right.$ $n / 2\}$
$\operatorname{and} C=\left\{v_{i} v_{(n / 2)+i} \in E\left(K_{n}\right): 1 \leq i \leq n / 2\right\} \cup\left\{v_{n} v_{1}\right\}$
Then $K_{n}=F \sqcup C$ is Eulerian and has an Euler tour $\operatorname{say} T=\left(v_{k_{1}}, v_{k_{2}}, \ldots v_{k_{N-n+1}}\right)$, where $v_{k_{1}}=v_{k_{N-n+1}}=$ $v_{1}$ and $N=\binom{n}{2}-n / 2$. Now let $G_{N}$ the graph obtained from the path $\left(v_{1}, v_{2}, \ldots v_{N+1}\right)$, by adding $\mathrm{n} / 2$ vertices
$\mathrm{w}_{1}, \mathrm{w}_{2}, \ldots . \mathrm{w}_{\mathrm{n} / 2}$ and joining $\mathrm{w}_{\mathrm{i}}$ with $\mathrm{u}_{\mathrm{i}}$. Now define $f: V\left(G_{N}\right) \rightarrow\{1,2, \ldots n\}$ by

$$
\begin{gathered}
f\left(u_{i}\right)=i ; \quad 1 \leq i \leq n \\
f\left(w_{i}\right)=(/ 2)+i ; \quad 1 \leq i \leq n / 2 \\
f\left(u_{n+j}\right)=k_{j} ; \quad 1 \leq j \leq N-n+1
\end{gathered}
$$

Then f Is an n -pseudo-complete coloring of $\mathrm{G}_{\mathrm{N}}$.
Since $\left|E\left(G_{N}\right)\right|=\binom{n}{2}, \mathrm{G}_{\mathrm{N}}$ is n-edge critical and $\mathrm{d}\left(\mathrm{G}_{\mathrm{N}}\right)=\mathrm{N}$.

Now for each i with $n=1 \leq I \leq N-$ 1, consider the edges $\left\{u_{j} u_{j+1}\right\}_{j=i+1}^{N}$ and let $c_{j}=$ $\min \left\{f\left(u_{j}\right), f\left(u_{j+1}\right)\right\} \quad$ and $\quad c_{j}^{\prime}=$ $\max \left\{f\left(u_{j}\right), f\left(u_{j+1}\right)\right\}$. Then, for each $\mathrm{j}, i+1 \leq j \leq$ $N$, remove the vertex $u_{j+1}$ from $\mathrm{P}_{\mathrm{N}+1}$ and add a vertex, with $c_{j}^{\prime}$ as its f-value, and join it to $u_{c_{j}}$. The resulting graph $G_{i}$ is n-edge critical and $\mathrm{d}\left(\mathrm{G}_{\mathrm{i}}\right)=\mathrm{i}$.
Theorem 3.3. Let $\mathrm{k}>3$ be any odd integer and let $G$ be a k-edge criticalEulerian graph. Then, $k \leq|V(G)| \leq\binom{ k}{2}$. Also, given any integer $n$ suchthat $k \leq n \leq\binom{ k}{2}$, there exists a k-edge critical Eulerian graph with exactly n vertices.
Proof. Since $|E(G)|=\binom{k}{2}$ and $G$ is not a tree, it follows that $k \leq|V(G)| \leq\binom{ k}{2}$. Now, the cycle $C_{\binom{k}{2}}$ is k-edge critical, by Proposition 2.8. If n is any integer such that $k \leq n \leq\binom{ k}{2}$, then by Proposition 2.6, a k-edge criticalEulerian graph on $n$ vertices can be obtained from $C_{\binom{k}{2}}$, by a sequence ofidentifications of vertices of
same color, with respect to any k-pseudo-complete coloring of $C_{\binom{k}{2}}$
Remark 3.4. Since in any $n$-pseudo-complete coloring of an n-edge critical graph, the sum of the degrees of all the vertices having same color is $\mathrm{n}-1$, it follows thatthere is no n -edge critical, Eulerian graph when n is an even integer.
Theorem 3.5.Let $G$ be $a$-edge critical Hamiltonian graph where $k \geq 3$.Then (i) $\mathrm{k} \leq|\mathrm{V}(\mathrm{G})| \leq\binom{\mathrm{k}}{2}$ and (ii) when k is even, $\mathrm{k} \leq|\mathrm{V}(\mathrm{G})| \leq\binom{\mathrm{k}}{2}-(\mathrm{k} / 2)$.Moreover, $|\mathrm{V}(\mathrm{G})|=\mathrm{k}$ if and only if $G=K_{k}$ and $|V(G)|=\binom{k}{2}$ with odd k if and only if $G=C_{\binom{k}{2}}$. Also, when $k$ is even, $|V(G)|=\binom{k}{2}-(k / 2)$ iff $\quad G \quad$ is $\quad$ a cycle, $C_{\binom{k}{2}-(k / 2)}=\left(v_{1}, v_{2}, \ldots v_{\binom{k}{2}-(k / 2)}, v_{1}\right)$ withk/2
chords $\left\{v_{n+i} v_{n+i+(k / 2)}\right\}_{i}$ where n is some integer such that $0<\mathrm{n}<\binom{\mathrm{k}}{2}-(\mathrm{k} / 2)$.
Proof.Since $|E(G)|=\binom{k}{2}$ and $G$ is not a tree, it follows that $k \leq|V(G)| \leq\binom{ k}{2}$ and $|\mathrm{V}(\mathrm{G})|=\mathrm{k}$ if and only if $\mathrm{G}=\mathrm{K}_{\mathrm{k}}$. Also, when k is odd, $|\mathrm{V}(\mathrm{G})|=$ $\binom{\mathrm{k}}{2}$ implies if $G=C_{\binom{k}{2}}$ and the converse follows from Proposition 2.8.

Now, suppose k is even. Let G be a k -edge critical Hamiltonian graph. Then it follows from Proposition 2.6 that the graph obtained from $G$ by identifying all pairs of vertices having same color, with respect to any k-pseudo-complete coloring of G, is isomorphic to $K_{k}$ and a cycle in $G$ corresponds to a closed trail of the same length in $K_{k}$. Since the maximum length ofa closed trail in $\mathrm{K}_{\mathrm{k}}$ is $\binom{\mathrm{k}}{2}-(\mathrm{k} / 2)$, we have $|V(G)| \leq\binom{\mathrm{k}}{2}-(\mathrm{k} /$ 2) Also, if $|V(G)|=\binom{k}{2}-(k / 2)$ then $G$ is a cycle on $\binom{\mathrm{k}}{2}-(\mathrm{k} / 2)$ verticeswith exactly $\mathrm{k} / 2$ chords and this cycle must correspond to a maximal Eulerian subgraph of $\mathrm{K}_{\mathrm{k}}$ so that the chords are as required. Converse is obvious.
