ABSTRACT
The object of this paper is to establish a general theorem pertaining to a product of class of polynomials and multivariable Gimel-function. Certains integrals are also obtained by application of the theorem. The theorem is quite general nature and capable of yielding a number of new, interesting and useful integrals as its special cases.

1. Introduction and preliminaries.

Throughout this paper, let $\mathbb{C},\mathbb{R}$ and $\mathbb{N}$ be set of complex numbers, real numbers and positive integers respectively. Also $\mathbb{N}_0 = \mathbb{N}\cup\{0\}$.

We define a generalized transcendental function of several complex variables noted $\gimel$.

$$\gimel(z_1,\cdots,z_r) = \gimel^{0,n_2;0,n_3;\cdots;0,n_r:m^{(1)},n^{(1)};m^{(2)},n^{(2)};\cdots;m^{(r)},n^{(r)}}_{p_{i_2},q_{i_2},\tau_{i_2};R_2;p_{i_3},q_{i_3},\tau_{i_3};R_3;\cdots;p_{i_r},q_{i_r},\tau_{i_r}:R_r:p_{i^{(1)}},q_{i^{(1)}},\tau_{i^{(1)}};R^{(1)};\cdots;p_{i^{(r)}},q_{i^{(r)}};\tau_{i^{(r)}};R^{(r)}}\left(\begin{array}{c|} \mathrm{z}_1 \\ \cdot \\ \cdot \\ \cdot \\ \mathrm{z}_r \end{array}\right.$$

The contour L_k is in the $s_k(k=1,\cdots,r)$- plane and run from $\sigma - i\infty$ to $\sigma + i\infty$ where σ if is a real number with loop, if necessary to ensure that the poles of $\Gamma^{A_{2j}}\left(1-a_{2j}+\sum_{k=1}^{2}\alpha_{2j}^{(k)}s_k\right)(j=1,\cdots,n_2),\Gamma^{A_{3j}}\left(1-a_{3j}+\sum_{k=1}^{3}\alpha_{3j}^{(k)}s_k\right)$ $(j=1,\cdots,n_3),\cdots,\Gamma^{A_{rj}}\left(1-a_{rj}+\sum_{i=1}^{r}\alpha_{rj}^{(i)}\right)(j=1,\cdots,n_r),\Gamma^{C_j^{(k)}}\left(1-c_j^{(k)}+\gamma_j^{(k)}s_k\right)(j=1,\cdots,n^{(k)})(k=1,\cdots,r)$to the right of the contour L_k and the poles of $\Gamma^{D_j^{(k)}}\left(d_j^{(k)}-\delta_j^{(k)}s_k\right)(j=1,\cdots,m^{(k)})(k=1,\cdots,r)$ lie to the left of the contour L_k. The condition for absolute convergence of multiple Mellin-Barnes type contour (1.1) can be obtained of the corresponding conditions for multivariable H-function given by as :

$|arg(z_k)| < \frac{1}{2}A_i^{(k)}\pi$ where

$$A_i^{(k)} = \sum_{j=1}^{m^{(k)}} D_j^{(k)}\delta_j^{(k)} + \sum_{j=1}^{n^{(k)}} C_j^{(k)}\gamma_j^{(k)} - \tau_{i^{(k)}}\left(\sum_{j=m^{(k)}+1}^{q_i^{(k)}} D_{ji^{(k)}}^{(k)}\delta_{ji^{(k)}}^{(k)} + \sum_{j=n^{(k)}+1}^{p_i^{(k)}} C_{ji^{(k)}}^{(k)}\gamma_{ji^{(k)}}^{(k)}\right)$$

$$-\tau_{i_2}\left(\sum_{j=n_2+1}^{p_{i_2}} A_{2ji_2}\alpha_{2ji_2}^{(k)} + \sum_{j=1}^{q_{i_2}} B_{2ji_2}\beta_{2ji_2}^{(k)}\right) - \cdots - \tau_{i_r}\left(\sum_{j=n_r+1}^{p_{i_r}} A_{rji_r}\alpha_{rji_r}^{(k)} + \sum_{j=1}^{q_{i_r}} B_{rji_r}\beta_{rji_r}^{(k)}\right) \tag{1.4}$$

Following the lines of Braaksma ([2] p. 278), we may establish the the asymptotic expansion in the following convenient form :

$$\aleph(z_1,\cdots,z_r) = 0(\,|z_1|^{\alpha_1},\cdots,|z_r|^{\alpha_r}\,)\,, max(\,|z_1|,\cdots,|z_r|\,) \rightarrow 0$$

$$\aleph(z_1,\cdots,z_r) = 0(\,|z_1|^{\beta_1},\cdots,|z_r|^{\beta_r}\,)\,, min(\,|z_1|,\cdots,|z_r|\,) \rightarrow \infty \text{ where } i=1,\cdots,r:$$

$$\alpha_i = \min_{1\leqslant j\leqslant m^{(i)}} Re\left[D_j^{(i)}\left(\frac{d_j^{(i)}}{\delta_j^{(i)}}\right)\right] \text{ and } \beta_i = \max_{1\leqslant j\leqslant n^{(i)}} Re\left[C_j^{(i)}\left(\frac{c_j^{(i)}-1}{\gamma_j^{(i)}}\right)\right]$$

Remark 1.
If $n_2=\cdots=n_{r-1}=p_{i_2}=q_{i_2}=\cdots=p_{i_{r-1}}=q_{i_{r-1}}=0$ and $A_{2j}=A_{2ji_2}=B_{2ji_2}=\cdots=A_{rj}=A_{rji_r}=B_{rji_r}=1$ $A_{rj}=A_{rji_r}=B_{rji_r}=1$, then the multivariable Gimel-function reduces in the multivariable Aleph- function defined by Ayant [1].

Remark 2.
If $n_2=\cdots=n_r=p_{i_2}=q_{i_2}=\cdots=p_{i_r}=q_{i_r}=0$ and $\tau_{i_2}=\cdots=\tau_{i_r}=\tau_{i^{(1)}}=\cdots=\tau_{i^{(r)}}=R_2=\cdots=R_r=R^{(1)}=\cdots=R^{(r)}=1$, then the multivariable Gimel-function reduces in a multivariable I-function defined by Prathima et al. [4].

Remark 3.
If$A_{2j}=A_{2ji_2}=B_{2ji_2}=\cdots=A_{rj}=A_{rji_r}=B_{rji_r}=1$and $\tau_{i_2}=\cdots=\tau_{i_r}=\tau_{i^{(1)}}=\cdots=\tau_{i^{(r)}}=R_2=\cdots=R_r=R^{(1)}=\cdots=R^{(r)}=1$, then the generalized multivariable Gimel-function reduces in multivariable I-function defined by Prasad [3].

Remark 4.
If the three above conditions are satisfied at the same time, then the generalized multivariable Gimel-function reduces in the multivariable H-function defined by Srivastava and Panda [7,8].

In your investigation, we shall use the following notations.

Srivastava ([6], p. 1, Eq. (1)) have introduced the general class of polynomials :

$$S^M_N(x) = \sum_{K=0}^{[N/M]} \frac{(-N)_{MK}}{K!} A_{N,K} x^K \quad (1.13)$$

where M is an arbitrary positive integer and the coeficients $A_{N,K}$ are arbitrary constants real or complex. On specializing these coefficients $A_{N,K}$, $S^M_N[.]$ yields a number of known polynomials as special cases. These include, among others, Hermite polynomials, Jacobi polynomials, Laguerre polynomials, bessel polynomials and several others([10], p. 158-161).

We shall note

$$a_{NK} = \frac{(-N)_{MK}}{K!} A_{N,K} \quad (1.14)$$

2. Main formula.

Theorem.

If ${}_2F_1(a,b;c;z){}_2F_1(a,b;cdz) = \sum_{l=0}^{\infty} C_l z^l$ (2.1)

then

$$\int_0^1 {}_4F_3\left[\begin{array}{c} \text{a, b, } \frac{c+d}{2}, \frac{c+b-1}{2} \\ \text{a+b, c, d} \end{array}\middle|\ \text{4z(1-z)}\right] S^M_N(z^h)\daleth\left(a_1 z^{h_1},\cdots,a_r z^{h_r}\right)\mathrm{d}z = \sum_{l=0}^{\infty}\sum_{K=0}^{[N/M]} a_{NK}\frac{(c+d-1)_l C_l}{(a+b)_l}$$

$$\gimel^{U;0,n_r+1:V}_{X;p_{i_r}+1,q_{i_r}+1,\tau_{i_r}:R_r:Y}\left(\begin{array}{c|c} a_1 & \mathbb{A};\ (\text{-l-Kh};h_1,\cdots,h_r;1),\mathbf{A}:A \\ \cdot & \cdot \\ \cdot & \cdot \\ a_r & \mathbb{B};\ \mathbf{B},(\text{-l-Kh-1};h_1,\cdots,h_r;1):B \end{array}\right) \tag{2.2}$$

provided

$$h,h_i>0(i=1,\cdots,r),\quad 1+\sum_{i=1}^{r}h_i\min_{1\leqslant j\leqslant m^{(i)}}Re\left(D_j^{(i)}\frac{d_j^{(i)}}{\delta_j^{(i)}}\right)>0$$

$|arg(a_iz^{h_i})|<\frac{1}{2}A_i^{(k)}\pi$ where $A_i^{(k)}$ is defined by (1.4) and the series on the right-hand side of (2.2) is absolutely convergent.

Proof

To prove the above theorem, we use the following formula due to Slater ([5], p. 79, Eq. (2.5.27))

$$_4F_3\left[\begin{array}{c|c} \text{a, b, }\frac{c+d}{2},\ \frac{c+b-1}{2} & \\ \text{a+b, c, d} & \text{4z(1-z)} \end{array}\right]=\sum_{l=0}^{\infty}\frac{(c+d-1)_l}{(a+b)_l}C_lz^l \tag{2.3}$$

where C_l is given by (2.1). Multiplying the both-sides of (2.3) by $S_N^M(z^h)\gimel\left(a_1z^{h_1},\cdots,a_rz^{h_r}\right)$and integrating with respect to z between 0 to 1, we get

$$\int_0^1 {}_4F_3\left[\begin{array}{c|c} \text{a, b, }\frac{c+d}{2},\ \frac{c+b-1}{2} & \\ \text{a+b, c, d} & \text{4z(1-z)} \end{array}\right]S_N^M(z^h)\gimel\left(a_1z^{h_1},\cdots,a_rz^{h_r}\right)\mathrm{d}z=\sum_{l=0}^{\infty}\frac{(c+d-1)_l}{(a+b)_l}C_lz^l$$

$$\int_0^1 z^lS_N^M(z^h)\gimel\left(a_1z^{h_1},\cdots,a_rz^{h_r}\right)\mathrm{d}z \tag{2.4}$$

Substituting the expression of the multivariable Gimel-function in terms of Mellin-Barnes multiple integrals contour with the help of (1.1) and $S_N^M[z^h]$ with the help of (1.13), interchanging the order of integrations and summation (which is permissible under the conditions mentioned in (2.2)), now, evaluating the inner z-integral and interpreting the Mellin-Barnes multiple integrals contour in terms of the multivariable Gimel-function, we get the desired result (2.2).

3. Particular cases.

Taking $b=c=d$ in the theorem, we get the following interesting integral :

Corollary 1.

$$\int_0^1 {}_2F_1\left[\begin{array}{c|c} \text{a, c-}\frac{1}{2}, & \\ \text{a+c} & \text{4z(1-z)} \end{array}\right]S_N^M(z^h)\gimel\left(a_1z^{h_1},\cdots,a_rz^{h_r}\right)\mathrm{d}z=\sum_{l=0}^{\infty}\sum_{K=0}^{[N/M]}a_{NK}\frac{(2c-1)_l(2a)_l}{(a+c)_l l!}$$

$$\gimel^{U;0,n_r+1:V}_{X;p_{i_r}+1,q_{i_r}+1,\tau_{i_r}:R_r:Y}\left(\begin{array}{c|c} a_1 & \mathbb{A};\ (\text{-l-Kh};h_1,\cdots,h_r;1),\mathbf{A}:A \\ \cdot & \cdot \\ \cdot & \cdot \\ a_r & \mathbb{B};\ \mathbf{B},(\text{-l-Kh-1};h_1,\cdots,h_r;1):B \end{array}\right) \tag{3.1}$$

under the same existence conditions mentioned in (2.2).

Taking $a=-e$ in the above corollary, it reduces to the interesting integral

Corollary 2.

$$\int_0^1 {}_2F_1\left[\begin{array}{c} \text{-e, c-}\frac{1}{2}, \\ \text{c-e} \end{array}\middle|\ \text{4z(1-z)}\ \right] S_N^M(z^h)\gimel\left(a_1 z^{h_1},\cdots,a_r z^{h_r}\right)\mathrm{d}z = \sum_{l=0}^{2e}\sum_{K=0}^{[N/M]} a_{NK}\frac{(2c-1)_l(-2e)_l}{(c-e)_l l!}$$

$$\gimel^{U;0,n_r+1:V}_{X;p_{i_r}+1,q_{i_r}+1,\tau_{i_r}:R_r:Y}\left(\begin{array}{c|c} \text{a}_1 & \mathbb{A};\ (\text{-l-Kh;h}_1,\cdots,h_r;1),\mathbf{A}:A \\ \cdot & \cdot \\ \cdot & \cdot \\ \text{a}_r & \mathbb{B};\ \mathbf{B},(\text{-l-Kh-1;h}_1,\cdots,h_r;1):B \end{array}\right) \tag{3.2}$$

under the same existence conditions mentioned in (2.2).

4. Conclusion.

The main integral (2.2) established here are unified and act as key formulae. Thus the multivariable Gimel-function occurring in these integrals can be suitably specialized to a remarkably wide variety of special functions (or product of several such special functions) which are expressible in terms of E, F, G, H, I, Aleph-functions of one or more variables. Again the class of polynomials involved in the integral (2.2) reduces to a large number of polynomials listed by Srivastava and Singh ([9], p.158-161), therefore, from the integral (2.2) we can further obtain various integrals involving a number of simpler polynomials.
