

On the Zeros of Lacunary Polynomials

M. H. Gulzar

Department of Mathematics

University of Kashmir, Srinagar 19000

Abstract : In this paper we find the bounds for the zeros of some special lacunary polynomials. Our results generalize some known results in the distribution of zeros of polynomials.

Mathematics Subject Classification: 30 C 10, 30 C 15

Keywords and Phrases: Coefficient, Polynomial, Zero

1. Introduction and Statement of Results

A classic result on the zeros of polynomials is the following theorem due to Cauchy[2]:

Theorem A: Let $P(z) = a_0 + a_1z + a_2z^2 + \dots + a_{n-1}z^{n-1} + a_nz^n, a_n \neq 0$ be a complex polynomial. Then all the zeros of $P(z)$ lie in the closed disk $|z| \leq r$, where r is the positive root of the equation

$$|a_0| + |a_1|z + \dots + |a_{n-1}|z^{n-1} - |a_n|z^n = 0.$$

Another classical result due to Cauchy [2] is the following:

Theorem B: : Let $P(z) = a_0 + a_1z + a_2z^2 + \dots + a_{n-1}z^{n-1} + a_nz^n, a_n \neq 0$ be a complex polynomial. Then all the zeros of $P(z)$ lie in the closed disk $|z| \leq 1 + M$, where

$$M = \max \left| \frac{a_j}{a_n} \right|, j = 0, 1, 2, \dots, n-1.$$

Similar results due to Dehmer [1] are the following:

Theorem C: Let $P(z) = a_0 + a_1z + a_2z^2 + \dots + a_{n-1}z^{n-1} + a_nz^n, a_n \neq 0$ be a complex polynomial. Then all the zeros of $P(z)$ lie in the closed disk $|z| \leq \max(1, k)$, where $k \neq 1$ is the positive root of the equation

$$z^{n+1} - (1 + M)z^n + M = 0$$

and $M = \max \left| \frac{a_j}{a_n} \right|, j = 0, 1, 2, \dots, n-1.$

Theorem D: Let $P(z) = a_0 + a_1z + a_2z^2 + \dots + a_{n-1}z^{n-1} + a_nz^n, a_n \neq 0$ be a complex polynomial. Then all the zeros of $P(z)$ lie in the closed disk $|z| \leq \max(1, k)$, where $k \neq 1$ is the positive root of the equation

$$z^{n+2} - (1 + M')z^{n+1} + M' = 0$$

$$\text{and } M' = \max \left| \frac{a_{n-j} - a_{n-j-1}}{a_n} \right|, j = 0, 1, 2, \dots, n; a_{-1} = 0.$$

The following result is the famous Enestrom-Keakeya Theorem [2]:

Theorem E: Let $P(z) = a_0 + a_1z + a_2z^2 + \dots + a_{n-1}z^{n-1} + a_nz^n, a_n \neq 0$ be a polynomial with real coefficients such that

$$a_n \geq a_{n-1} \geq \dots \geq a_1 \geq a_0 > 0.$$

Then all the zeros of $P(z)$ lie in the closed disk $|z| \leq 1$.

In this paper, we consider some special lacunary polynomials and see what happens to Theorems A, B, C, D and E. In fact, we prove the following results:

Theorem 1: Let $P(z) = a_0z^n + a_pz^{n-p} + a_{p+1}z^{n-p-1} + \dots + a_{n-1}z + a_n, a_p \neq 0, p < n$, be a polynomial of degree n . Then all the zeros of $P(z)$ lie in $|z| \leq k$, where $k > 1$ is the root of the equation

$$k^p - k^{p-1} + M = 0$$

$$\text{and } M = \max \left| \frac{a_j}{a_0} \right|, j = p, p+1, \dots, n.$$

Remark 1: Taking $p=1$ in Theorem 1, we get $k=1+M$ so that Theorem 1 reduces to Theorem A.

Theorem 2: Let $P(z) = a_0 + a_1z + a_2z^2 + \dots + a_pz^p + a_nz^n, a_p \neq 0, 1 \leq p \leq n-1$, be a polynomial of degree n . Then all the zeros of $P(z)$ lie in $|z| \leq \max(1, k)$, where $k \neq 1$ is the positive root of the equation

$$z^{n+1} - z^n - Mz^{p+1} + M = 0$$

$$\text{and } M = \max \left| \frac{a_j}{a_n} \right|, j = 0, 1, 2, \dots, p.$$

Remark 2: Taking $p=n-1$ in Theorem 1, we get Theorem B of Dehmer.

Theorem 3: Let $P(z) = a_0 + a_1z + a_2z^2 + \dots + a_pz^p + a_nz^n, a_p \neq 0, 1 \leq p \leq n-1$, be a polynomial of degree n . Then all the zeros of $P(z)$ lie in $|z| \leq k$, where k is the greatest positive root of the equation

$$z^{n+2} - 2z^{n+1} + z^n - M'z^{p+1} + M' = 0$$

$$\text{and } M' = \max \left| \frac{a_j - a_{j-1}}{a_n} \right|, j = 0, 1, 2, \dots, p; a_{-1} = 0.$$

Theorem 4: Let $P(z) = a_0 + a_1z + a_2z^2 + \dots + a_pz^{n-p} + a_nz^n, a_p \neq 0, p < n$, be a polynomial of degree n such that

$$a_p \geq a_{p-1} \geq \dots \geq a_1 \geq a_0.$$

Then all the zeros of $P(z)$ lie in the closed disk

$$|z| \leq \frac{1}{|a_n|} [|a_n| + a_p - a_0 + |a_0|]$$

2. Proofs of Theorems

Proof of Theorem 1: For $|z| > 1, \frac{1}{|z|^j} < 1, \forall j = p, p+1, \dots, n$, so that, by using the hypothesis, we have

$$\begin{aligned} |P(z)| &= |a_0z^n + a_pz^{n-p} + a_{p+1}z^{n-p-1} + \dots + a_{n-1}z + a_n| \\ &\geq |z|^n [1 - \{ \frac{|a_p|}{|a_0|} \cdot \frac{1}{|z|^p} + \frac{|a_{p+1}|}{|a_0|} \cdot \frac{1}{|z|^{p+1}} + \dots + \frac{|a_{n-1}|}{|a_0|} \cdot \frac{1}{|z|^{n-1}} + \frac{|a_n|}{|a_0|} \cdot \frac{1}{|z|^n} \}] \\ &\geq |z|^n [1 - M \{ \frac{1}{|z|^p} + \frac{1}{|z|^{p+1}} + \dots + \frac{1}{|z|^n} \}] \\ &> |z|^n [1 - M \{ \frac{1}{|z|^p} + \frac{1}{|z|^{p+1}} + \dots + \frac{1}{|z|^n} + \dots \}] \\ &= |z|^n [1 - \frac{M}{|z|^{p-1}(|z|-1)}] \\ &= \frac{|z|^n [|z|^p - |z|^{p-1} - M]}{|z|-1} \\ &> 0 \end{aligned}$$

if

$$|z|^p - |z|^{p-1} - M > 0.$$

This shows that the zeros of $P(z)$ with modulus greater than 1 lie in the closed disk $|z| \leq k$, where $k > 1$ is the root of the equation

$$k^p - k^{p-1} + M = 0.$$

Since the zeros of $P(z)$ of modulus less than or equal to 1 are already in $|z| \leq k$, the result follows.

Proof of Theorem 2: For $|z| > 1$, we have $\frac{1}{|z|^{n-j}} < 1, \forall j = 0, 1, 2, \dots, p$, so that

$$\begin{aligned} |P(z)| &= |a_n z^n + a_p z^p + a_{p-1} z^{p-1} + \dots + a_1 z + a_0| \\ &\geq |a_n| |z|^n - \{|a_p| |z|^p + |a_{p-1}| |z|^{p-1} + \dots + |a_1| |z| + |a_0|\} \\ &= |a_n| [|z|^n - |z|^p \{ \frac{|a_p|}{|a_n|} + \frac{|a_{p-1}|}{|a_n|} \cdot \frac{1}{|z|} + \dots + \frac{|a_1|}{|a_n|} \cdot \frac{1}{|z|^{p-1}} + \frac{|a_0|}{|a_n|} \cdot \frac{1}{|z|^p} \}] \\ &\geq |a_n| [|z|^n - |z|^p \{M + \frac{M}{|z|} + \frac{M}{|z|^2} + \dots + \frac{M}{|z|^{p-1}} + \frac{M}{|z|^p}\}] \\ &= |a_n| [|z|^n - |z|^p M \{1 + \frac{1}{|z|} + \frac{1}{|z|^2} + \dots + \frac{1}{|z|^{p-1}} + \frac{1}{|z|^p}\}] \\ &= |a_n| [|z|^n - \frac{M(|z|^{p+1} - 1)}{|z| - 1}] \\ &= \frac{|a_n| [|z|^{n+1} - |z|^n - M|z|^{p+1} + M]}{|z| - 1} \\ &> 0 \end{aligned}$$

if

$$|z|^{n+1} - |z|^n - M|z|^{p+1} + M > 0.$$

Define

$$F(z) = z^{n+1} - z^n - Mz^{p+1} + M.$$

By using Descartes's Rule of Signs, $F(z)$ has exactly two positive zeros k_1 and k_2 and $F(k_1) = 0$ with $\text{Sign}\{F(0)\} = 1$. Hence we conclude that

$$|F(z)| > 0 \text{ for } |z| > \max(1, k).$$

Hence, it follows that all the zeros of $P(z)$ lie in $|z| \leq \max(1, k)$, where $k \neq 1$ is the positive root of the equation

$$z^{n+1} - z^n - Mz^{p+1} + M = 0.$$

That proves Theorem 2.

Proof of Theorem 3: Consider the polynomial

$$\begin{aligned} F(z) &= (1-z)P(z) = (1-z)(a_n z^n + a_p z^p + \dots + a_1 z + a_0) \\ &= -a_n z^{n+1} + a_n z^n + (a_p - a_{p-1})z^p + (a_{p-1} - a_{p-2})z^{p-1} + \dots + (a_1 - a_0)z + a_0. \end{aligned}$$

For $|z| > 1$, we have, by using the hypothesis,

$$\begin{aligned}
 |F(z)| &\geq |a_n||z|^{n-1} - |a_n z^n + (a_p - a_{p-1})z^p + (a_{p-1} - a_{p-2})z^{p-1} + \dots + (a_1 - a_0)z + a_0| \\
 &\geq |a_n| \left[|z|^{n+1} - |z|^n - |z|^p \left\{ \frac{|a_p - a_{p-1}|}{|a_n|} + \frac{|a_{p-1} - a_{p-2}|}{|a_n||z|} + \dots + \frac{|a_1 - a_0|}{|a_n||z|^{p-1}} + \frac{|a_0 - a_{-1}|}{|a_n||z|^p} \right\} \right] \\
 &\geq |a_n| \left[|z|^{n+1} - |z|^n - |z|^p \left\{ M' + \frac{M'}{|z|} + \dots + \frac{M'}{|z|^{p-1}} + \frac{M'}{|z|^p} \right\} \right] \\
 &= |a_n| \left[|z|^{n+1} - |z|^n - |z|^p M' \left\{ 1 + \frac{1}{|z|} + \dots + \frac{1}{|z|^{p-1}} + \frac{1}{|z|^p} \right\} \right] \\
 &= |a_n| \left[|z|^{n+1} - |z|^n - \frac{(|z|^{p+1} - 1)M'}{|z| - 1} \right] \\
 &= \frac{|a_n| \left[|z|^{n+2} - 2|z|^{n+1} + |z|^n - M'|z|^{p+1} + M' \right]}{|z| - 1} \\
 &> 0
 \end{aligned}$$

if

$$|z|^{n+2} - 2|z|^{n+1} + |z|^n - M'|z|^{p+1} + M' > 0.$$

This shows that the zeros of F(z) with modulus greater than 1 lie the closed disk $|z| \leq k$, where k is the greatest positive root of the equation

$$z^{n+2} - 2z^{n+1} + z^n - M'z^{p+1} + M' = 0$$

Since z=1 is a zero of the above equation, it follows that the zeros of F(z) with modulus less than 1 also lie in $|z| \leq k$.

Since the zeros of P(z) are also the zeros of F(z), it follows that all the zeros of P(z) lie in the closed disk $|z| \leq k$, where k is the greatest positive root of the equation

$$z^{n+2} - 2z^{n+1} + z^n - M'z^{p+1} + M' = 0,$$

thereby proving Theorem 3.

Proof of Theorem 4: Consider the polynomial

$$\begin{aligned}
 F(z) &= (1 - z)P(z) = (1 - z)(a_n z^n + a_p z^p + \dots + a_1 z + a_0) \\
 &= -a_n z^{n+1} + a_n z^n + (a_p - a_{p-1})z^p + (a_{p-1} - a_{p-2})z^{p-1} + \dots + (a_1 - a_0)z + a_0.
 \end{aligned}$$

For $|z| > 1$, we have, by using the hypothesis,

$$\begin{aligned}
 |F(z)| &\geq |a_n||z|^{n+1} - |z|^n \left\{ |a_n| + \frac{|a_p - a_{p-1}|}{|z|^{n-p}} + \frac{|a_{p-1} - a_{p-2}|}{|z|^{n-p+1}} + \dots + \frac{|a_1 - a_0|}{|z|^{n-1}} + \frac{|a_0|}{|z|^n} \right\} \\
 &> |z|^n [|a_n||z| - \{|a_n| + a_p - a_{p-1} + a_{p-1} - a_{p-2} + \dots + a_1 - a_0 + |a_0|\}] \\
 &= |z|^n [|a_n||z| - \{|a_n| + a_p - a_0 + |a_0|\}] \\
 &> 0
 \end{aligned}$$

if

$$|a_n||z| - \{|a_n| + a_p - a_0 + |a_0|\} > 0$$

i.e. $|z| > \frac{1}{|a_n|} [|a_n| + a_p - a_0 + |a_0|].$

This shows that the zeros of F(z) with modulus greater than 1 lie in the closed disk

$$|z| \leq \frac{1}{|a_n|} [|a_n| + a_p - a_0 + |a_0|].$$

Since the zeros of F(z) with modulus less than 1 already lie in the above disk, it follows that all the zeros of F(z) lie in the closed disk

$$|z| \leq \frac{1}{|a_n|} [|a_n| + a_p - a_0 + |a_0|].$$

Since the zeros of P(z) are also the zeros of F(z), the result follows.
