# Index of labeling 

M M Jariya
Government Science College

#### Abstract

In this paper we have proved that the index of cordiality for $K_{n}$ is atmost 4, when $n$ can be expressed as sum of square of two integers and also it is atmost 4 for different conditions of $d_{i}$, where $d_{i}=e_{f}(1)-e_{f}(0)$ for some binary vertex labeling function $f$ on $K_{n}$.

Key words : Complete graph, binary vertex labeling, index of cordiality for a graph.
AMS subject classification number : 05C78.

## 1. Introduction

Let $G$ be a simple, undirected finite graph with $p=|V(G)|$ vertices and $q=|E(G)|$ edges. We follows Harary [4] for all basic terminology and standard notations. In this paper we have used following definition.

Definition-1.1: A function $f: V(G) \longrightarrow\{0,1\}$ is called a binary vertex labeling of a graph $G$ and $f(v)$ is called label of the vertex $v$ of $G$ under $f$. The induced function $f^{*}: E(G) \longrightarrow\{0,1\}$ is defined as $f^{*}(e)=f(u)+f(v)(\bmod 2)$, for every edge $e=(u, v) \in E(G)$. Let $v_{f}(0), v_{f}(1)$ be number of vertices of $G$ having labels 0 and 1 respectively under $f$ and let $e_{f}(0), e_{f}(1)$ be number of edges of $G$ having labels 0 and 1 respectively under $f^{*}$. A binary vertex labeling $f$ of a graph $G$ is called a cordial labeling if $\left|v_{f}(0)-v_{f}(1)\right| \leq 1$ and $\left|e_{f}(0)-e_{f}(1)\right| \leq 1$. A graph which admits a cordial labeling is called a cordial graph.
Definition-1.2: Let $G$ be a graph and $G^{(1)}, G^{(2)}, \ldots, G^{(n)}, n \geq 2$ be $n$ copies of $G$. Let $v \in V(G)$. The graph obtained by joining vertex $v$ of $G^{(i)}$ with same vertex of $G^{(i+1)}$ by an edge, $\forall i=1,2, \ldots, n-1$ and $v$ of $G^{(n)}$ with the same vertex of $G^{(1)}$ by an edge is called cycle of $G$. It is denoted by $C(n \cdot G)$. If we replace $G$ by $C(n \cdot G)$, such graph becomes $C\left(n \cdot C(n \cdot G)\right.$ ), we denote it by $C^{2}(n \cdot G)$. In general for any $t \geq 2, C^{t}(n \cdot G)=$ $C\left(n \cdot C^{t-1}(n \cdot G)\right)$. Therefore $C\left(n \cdot K_{1}\right)=C_{n}$.
Definition-1.3 : Let $G$ be a connected graph. If union of $n$ copies of $G\left(\bigcup_{i=1}^{n} G\right)$ is cordial but $\bigcup_{i=1}^{l} G$ do not have cordial labeling for every $l<n$, the index of cordiality for $G$ is $n$.
1.4 Discussion on cordiality of $K_{n}$ : Kaneria and Jariya proved that The index of cordiality for $K_{n}(n \leq 105)$ is at the most 6 . Also they have computed table- 1 and table- 2 which contain different type of vertex labels to find required conditions $\left|v_{f}(1)-v_{f}(0)\right|$ $\leq 1,\left|e_{f}(1)-e_{f}(0)\right| \leq 1$ in union of specified copies of $K_{n}$. Last column of table-1, 2 shows maximum index of cordiality for $K_{n}$.

## 2. Main Results

Theorem-2.1 The index of cordiality for $K_{n}$ is at the most 4, When n is sum of squares of two integers.
Proof : We assume $n=i^{2}+j^{2}$, for some $i, j \in N$ and $i \geq j$. Here we prove that union of four copies of $K_{n}$ is cordial. For this, it is enough to show that $d_{t}+d_{l}=0$, for some $t, l \in N$ and $1 \leq t, l \leq \max \{i, j\}+1$. Here the following cases are to be considered :

Case-I : $i=j$. In this case $n$ is even.
Moreover $d_{1}=\frac{i^{2}+j^{2}}{2}=i^{2}, d_{2}=i^{2}-2, d_{3}=i^{2}-8, \ldots, d_{k}=i^{2}-2 k+4 k-2$.
If $d_{1}+d_{k}=0, d_{k}=i^{2}-2 k^{2}+4 k-2=-i^{2}$
$\Rightarrow 2 i^{2}=2 k^{2}-4 k+2$
$\Rightarrow i^{2}=(k-1)^{2}$
$\Rightarrow k=i+1$. In this case, we get $d_{1}+d_{i+1}=0$.
Case-II : $i=j+1$. In this case, $n$ is odd.
Moreover, $d_{1}=\frac{1}{2}\left(i^{2}+j^{2}-1\right)=i(i-1), d_{2}=i(i-1)-4, d_{3}=i(i-1)-10, \ldots$, $d_{k}=i(i-1)-2 k(k-1)$.

If $d_{1}+d_{k}=0, i(i-1)-2 k(k-1)=-i(i-1)$
$\Rightarrow k=i$. So, we get $d_{1}+d_{i}=0$.
Case-III : $i=j+2$. Here, $n$ is even and
$d_{1}=\frac{1}{2}\left(i^{2}+(i-2)^{2}\right)=i^{2}-2 i+2, d_{2}=i^{2}-2 i, \ldots, d_{k}=i^{2}-2 i+2-2 k^{2}+4 k-2$.
If $d_{2}+d_{k}=0, i^{2}-2 i-2 k^{2}+4 k=-i^{2}+2 i$
$\Rightarrow k=i$ and so, we get $d_{2}+d_{i}=0$.
Case-IV : $i=j+3$. Here, $n$ is odd and
$d_{1}=i^{2}-3 i+4, d_{2}=i^{2}-3 i, \ldots, d_{k}=i^{2}-3 i-4-2 k(k-1)$.
If $d_{2}+d_{k}=0, i^{2}-3 i+4-2 k(k-1)=-i^{2}+3 i$
$\Rightarrow i^{2}-3 i+2=k(k-1)$
$\Rightarrow(i-1)(i-2)=k(k-1)$
$\Rightarrow k=i-1$ and so, we get $d_{2}+d_{i-1}=0$.
General Case : Take $i=j+s$ i.e. $s=i-j$.
Subcase-I : $s$ is even.
In this case, either $i, j$ both are even or both are odd and so $n=i^{2}+j^{2}$ is even.

We prove that $d_{t}+d_{l}$ and $t=i-\frac{s}{2}-1, l=\frac{s}{2}+1$.
Since $n$ is even, $d_{1}=\frac{1}{2}\left(i^{2}+j^{2}\right), d_{2}=\frac{1}{2}\left(i^{2}+j^{2}\right)-2, \ldots, d_{k}=\frac{1}{2}\left(i^{2}+j^{2}\right)-2 k^{2}+4 k-2$.

$$
\begin{aligned}
& \Rightarrow d_{t}=\frac{1}{2}\left(i^{2}+j^{2}\right)-2\left(i-\frac{s}{2}-1\right)^{2}-4\left(i-\frac{s}{2}-1\right)-2 \\
& \quad=\frac{1}{2}\left(i^{2}+j^{2}\right)-2\left(i^{2}+1+\frac{s^{2}}{4}-i s-2 i+s\right)-4 i+2 s+2 \\
& =\frac{1}{2}\left(j^{2}-s^{2}-3 i^{2}\right)+2 i s \quad \text { and } d_{l}=\frac{1}{2}\left(i^{2}+j^{2}\right)-2\left(\frac{s}{2}+1\right)^{2}+4\left(\frac{s}{2}+1\right)-2 \\
& \quad=\frac{1}{2}\left(i^{2}+j^{2}\right)-2\left(\frac{s^{2}}{4}+s+1\right)+2 s+2 \\
& =\frac{1}{2}\left(i^{2}+j^{2}-s^{2}\right) \\
& \Rightarrow d_{t}+d_{l}=j^{2}-s^{2}-i^{2}+2 i s \\
& \quad=j^{2}-(i-j)^{2}-i^{2}+2 i(i-j) \\
& \quad=j^{2}-i^{2}-j^{2}+2 i j-i^{2}+2 i^{2}-2 i j \\
& \quad=0
\end{aligned}
$$

Subcase-II : $s$ is odd.
In this case, $n=i^{2}+j^{2}$ is odd.
We prove that $d_{t}+d_{l}=0$ and $t=i-\frac{s-1}{2}, l=\frac{s+1}{2}$.
Since $n$ is odd, $d_{1}=\frac{1}{2}\left(i^{2}+j^{2}-1\right), d_{2}=\frac{1}{2}\left(i^{2}+j^{2}-1\right)-4, \ldots, d_{k}=\frac{1}{2}\left(i^{2}+j^{2}-1\right)-2 k(k-1)$.

$$
\begin{aligned}
\Rightarrow d_{t} & =\frac{1}{2}\left(i^{2}+j^{2}-1\right)-2\left(i-\frac{s-1}{2}\right)\left(i-\frac{s-1}{2}-1\right) \\
& =\frac{1}{2}\left(i^{2}+j^{2}-1\right)-2\left[i^{2}-\frac{(s-1)^{2}}{4}-i(s-1)-i+\frac{s-1}{2}\right] \\
& =\frac{1}{2}\left(i^{2}+j^{2}-1\right)-2 i^{2}-\frac{1}{2}\left(s^{2}-2 s+1\right)+2 i s-s+1 \\
& =\frac{1}{2}\left(i^{2}+j^{2}-1\right)-2 i^{2}-\frac{s^{2}}{2}+s+2 i s-s+\frac{1}{2} \\
& =\frac{1}{2}\left(i^{2}+j^{2}\right)-2 i^{2}-\frac{s^{2}}{2}+2 i s
\end{aligned}
$$

and $d_{l}=\frac{1}{2}\left(i^{2}+j^{2}-1\right)-2\left(\frac{s+}{2}\right)\left(\frac{s-1}{2}\right)$

$$
=\frac{1}{2}\left(i^{2}+j^{2}-1\right)-\frac{1}{2}\left(s^{2}-1\right)
$$

$$
=\frac{1}{2}\left(i^{2}+j^{2}-s^{2}\right)
$$

$\Rightarrow d_{t}+d_{l}=i^{2}+j^{2}-s^{2}-2 i^{2}+2 i s=j^{2}-s^{2}-i^{2}+2 i s=0$
Table -5 is computed according to above cases and it shows values of $t$ and $l$ to get $d_{t}+d_{l}=0$. Thus, $\cup_{l=1}^{4} K_{n}\left(n=i^{2}+j^{2}\right)$ is a cordial graph and so the index of cordiality for $K_{n}\left(n=i^{2}+j^{2}\right)$ is at the most 4.

Illustration-2.2 : Index of cordiality for $K_{80}$ is at the most 4.
The edge label difference sequence $K_{80}$ is $d_{1}=40, d_{2}=38, d_{3}=32, d_{4}=22, d_{5}=8$, $d_{6}=-10, d_{7}=-32, d_{8}=-58$ and $d_{9}=-88$. According to table $-5,80=8^{2}+4^{2}$ and therefore, the value of $t=8-\left\lfloor\frac{4-1}{2}\right\rfloor=7, l=\left\lceil\frac{4+1}{2}\right\rceil=3$. Moreover $d_{3}+d_{7}=0$. Table -6 establishes that union of four copies of $K_{80}$ is cordial and so the index of cordiality for $K_{80}$ is at the most 4.

Theorem-2.3: If $D_{j}=4$ in $K_{n}, D_{j-2}+2 D_{j}+D_{j+2}=0$, and in this case, the index of cordiality for $K_{n}$ is at the most 4 .

Proof : According to discussion of cordiality of $K_{n}$,

$$
\begin{aligned}
& \quad D_{j}=\frac{n-1}{2}-2\left(j^{2}+1\right), \quad \text { when } n \text { is odd. } \\
& =\frac{n}{2}-2 j^{2}, \quad \text { when } n \text { is even } \\
& \Rightarrow D_{j-1}-D_{j-2}=D_{j}-D_{j-1}+4=D_{j+1}-D_{j}+8 \\
& =D_{j+2}-D_{j+1}+12 \\
& \Rightarrow D_{j-2}+D_{j}=2 D_{j-1}-4, \\
& D_{j+2}+D_{j}=2 D_{j+1}-4 \text { and } \\
& \begin{aligned}
& D_{j+1}+D_{j-1}= D_{j}-4 . \\
& \Rightarrow D_{j+2}+2 D_{j}+D_{j-2}=2\left(D_{j+1}+D_{j-1}\right)-8 \\
&=2\left(2 D_{j}-4\right)-8 \\
&==2(2 \cdot 4-4)-8 \\
&=0
\end{aligned}
\end{aligned}
$$

Since difference of vertex labels for $D_{j}, D_{j-2}$ and $D_{j+2}, D_{j}$ are precisely two, we get $v_{f}(0)=v_{f}(1)$ and $e_{f}(1)-e_{f}(0)=D_{j-2}+2 D_{j}+D_{j+2}=0$ in $\cup_{j=1}^{4} K_{n}$. Thus $\cup_{j=1}^{4} K_{n}$ is cordial and the index of cordiality for $K_{n}$ is at the most 4 , when $D_{j}=4$, for some $i$.

Illustration-2.4 : The index of cordiality for $K_{44}$ is at the most 4, because according to table $-1, D_{4}=d=4$ and $D_{2}+2 D_{4}+D_{6}=b+2 d+f=20+8-28=0$.

Theorem-2.5 : If $D_{j}=5$ in $K_{n}, D_{j-2}+D_{j-1}+D_{j+1}+D_{j+2}=0$, and in this case, the index of cordiality for $K_{n}$ is at the most 4.

Proof : By Theorem-2.3

$$
\begin{aligned}
& D_{j+2}+D_{j-2}+2 D_{j}=2\left(D_{j+1}+D_{j-1}\right)-8 \\
\Rightarrow & D_{j+2}+D_{j-2}+D_{j+1}+D_{j-1}+4=2\left(2 D_{j}-4\right)-8 \\
\Rightarrow & D_{j+2}+D_{j+1}+D_{j-1}+D_{j-2}=2(2 \cdot 5-4)-8-4=0
\end{aligned}
$$

Since difference of vertex labels for $D_{j+2}, D_{j+1}$ and $D_{j-1}, D_{j-2}$ are 1 , we get $v_{f}(0)=$ $v_{f}(1)$ and $e_{f}(1)-e_{f}(0)=D_{i+2}+D_{i+1}+D_{i-1}+D_{i-2}=0$ in the union of four copies of $K_{n}$ and so it is cordial. Thus, the index of cordiality for $K_{n}$ is at the most 4 , when $D_{j}=5$, for some $j$.

Theorem-2.6 : If $D_{j}=9$ in $K_{n}, D_{j-3}+2 D_{j}+D_{j+3}=0$, and in this case, the index of cordiality for $K_{n}$ is at the most 4 .

Proof : According to proof of Theorem-2.3

$$
\begin{gathered}
\quad D_{j-2}-D_{j-3}=D_{j-1}-D_{j-2}+4=D_{j}-D_{j-1}+8 \\
=D_{j+1}-D_{j}+12=D_{j+2}-D_{j+1}+16 \\
=D_{j+3}-D_{j+2}+20 \\
\Rightarrow D_{j+3}-D_{j}=3\left(D_{j-2}-D_{j-3}\right)-48 \\
D_{j}-D_{j-3}=3\left(D_{j-2}-D_{j-3}\right)-12 \\
\Rightarrow D_{j+3}+D_{j-3}=-48+12+2 D_{j} \\
\Rightarrow D_{j+3}+2 D_{j}+D_{j-3}=4 D_{j}-36=0
\end{gathered}
$$

Since difference of vertex labels for $D_{j+3}, D_{j}$ and $D_{j}, D_{j-3}$ are 3 , we get $v_{f}(0)=v_{f}(1)$ and $e_{f}(1)-e_{f}(0)=D_{j-3}+2 D_{j}+D_{j+3}=0$ in the union of four copies of $K_{n}$ and so it is cordial. Thus, the index of cordiality for $K_{n}$ is at the most 4 , when $D_{j}=9$, for some $j$.

Table-3

Here in each case $d_{t}+d_{l}=0$.

| Order of copy in $K_{80}$ | $v_{f}(0)$ | $v_{f}(1)$ | $e_{f}(1)$ | $v_{f}(1)$ | Diff. |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 42 | 38 | 1196 | 1564 | 32 |
| 2 | 38 | 42 | 1196 | 1564 | 32 |
| 3 | 46 | 34 | 1564 | 1196 | -32 |
| 4 | 34 | 46 | 1564 | 1196 | -32 |
| Total | 160 | 160 | 5520 | 5520 | 0 |

Table-4

## 4 Concluding Remarks :

In research the study of variety of graph labeling problems is the potential area. In this paper cordial labeling for union of some copies of the complete graph and the index of cordiality for the complete graph are discussed.
