**Abstract:** The aim of this paper is to introduce and study a new class of spaces, namely ii-regular spaces by using ii-open sets. The relationships among regular, strongly rg-regular, almost regular, softly regular, weakly regular,  $\alpha$ -regular, s-regular and ii-regular spaces are investigated. Also we obtain some characterizations of ii-regular spaces, properties of the forms of gii-closed, iig-closed functions and preservation theorems for ii-regular spaces.

**Key words:** ii-open sets; ii-regular, s-regular, almost regular and softly regular spaces; gii-closed and ii-gii-closed functions.

**2010 Mathematics Subject Classification:** 54C10, 54D10.

## 1. Introduction

N. Levine [7] introduced the concept of semi-open sets in topological spaces. O. Njastad [10] introduced and studied the notion of  $\alpha$ -open sets. M. K. Singal and S. P. Arya [12] introduced two new classes of regular spaces, namely almost regular and weakly regular. S. N. Maheshwari and R. Prasad [8] defined a new class of regular spaces called s-regular. S. S. Benchalli [1] introduced and studied the notion of  $\alpha$ -regular spaces. M. C. Sharma, P. Sharma and M. Singh [11] introduced a new class of regular spaces called  $\xi$ -regular spaces. Hamant Kumar [6] obtained some more characterizations and preservation theorems for  $\xi$ -regular spaces. Hamant Kumar and M. C. Sharma [3] introduced two new classes of separation axioms, namely softly regular and partly regular spaces which are weaker than regular spaces. Hamant Kumar [4] introduced some new types of separation axioms, namely ii- $T_0$ , ii- $T_1$  and ii- $T_2$  etc. in topological spaces by using ii-open sets due to A. A. Mohammed and B. S. Abdullah [9]. Hamant Kumar [5] introduced two new classes of sets called gii-closed and iig-closed and by using these sets, obtained some characterizations of ii-normal spaces and properties of the forms of generalized ii-closed functions.

In this paper, we utilize ii-open sets to define and study a new class of spaces, called ii-regular spaces in topology. The relationships among regular, strongly rg-regular, almost regular, softly regular, weakly regular,  $\alpha$ -regular, s-regular and ii-regular spaces are investigated. Also we obtain some characterizations and preservation theorems for ii-regular spaces.

## 2. Preliminaries

Throughout this paper, spaces  $(X, \tau)$ ,  $(Y, \sigma)$ , and  $(Z, \gamma)$  always mean topological spaces on which no separation axioms are assumed unless explicitly stated. Let  $A$  be a subset of a space  $X$ . The closure of  $A$  and interior of  $A$  are denoted by  $\text{cl}(A)$  and  $\text{int}(A)$  respectively.

**2.1 Definition.** A subset  $A$  of a space  $(X, \mathfrak{T})$  is said to be:

- (1) **semi-open** [7] if  $A \subset \text{cl}(\text{int}(A))$ .
- (2)  **$\alpha$ -open** [10] if  $A \subset \text{int}(\text{cl}(\text{int}(A)))$ .
- (3) **ii-open** [9] set if there exists an open set  $G \in \mathfrak{T}$ , such that
  - (i)  $G \neq \phi, X$
  - (ii)  $A \subset \text{cl}(A \cap G)$
  - (iii)  $\text{int}(A) = G$ .

**2.2 Remark.** We have the following implications for the properties of subsets:

open  $\rightarrow$   $\alpha$ -open  $\rightarrow$  s-open  $\rightarrow$  ii-open

Where none of the implications is reversible as can be seen from [9].

The complement of a  $s$ -open (resp.  $\alpha$ -open,  $ii$ -open,) set is called  **$s$ -closed** (resp.  **$\alpha$ -closed,  $ii$ -closed**).

The intersection of all  $ii$ -closed sets containing  $A$ , is called the  **$ii$ -closure** of  $A$  and is denoted by  **$ii-cl(A)$** . Dually, the  **$ii$ -interior** of  $A$ , denoted by  **$ii-int(A)$**  is defined to be the union of all  $ii$ -open sets contained in  $A$ .

The family of all  $ii$ -open (resp.  $ii$ -closed) sets of a space  $X$  is denoted by  $ii-O(X)$  (resp.  $ii-C(X)$ ).

**2.3 Definition.** A subset  $A$  of a space  $(X, \mathfrak{T})$  is said to be

- (1) **generalized  $ii$ -closed** [5] (briefly  **$gii$ -closed**) if  $ii-cl(A) \subset U$  whenever  $A \subset U$  and  $U \in \mathfrak{T}$ .
- (2)  **$ii$ -generalized closed** [5] (briefly  **$iig$ -closed**) if  $ii-cl(A) \subset U$  whenever  $A \subset U$  and  $U \in ii-O(X)$ .

The complement of  $gii$ -closed (resp.  $iig$ -closed) set is said to be  **$gii$ -open** (resp.  **$iig$ -open**).

**2.4 Remark.** We have the following implications for the properties of subsets:

$$\text{closed} \rightarrow ii\text{-closed} \rightarrow gii\text{-closed} \rightarrow iig\text{-closed}$$

Where none of the implications is reversible as can be seen from [5]:

**2.5 Lemma.** Let  $A$  be a subset of a space  $X$  and  $x \in X$ . The following properties hold for  $ii-cl(A)$  :

- (i)  $x \in ii-cl(A)$  if and only if  $A \cap U \neq \emptyset$  for every  $U \in ii-O(X)$  containing  $x$ .
- (ii)  $A$  is  $ii$ -closed if and only if  $A = ii-cl(A)$ .
- (iii)  $ii-cl(A) \subset ii-cl(B)$  if  $A \subset B$ .
- (iv)  $ii-cl(ii-cl(A)) = ii-cl(A)$ .
- (v)  $ii-cl(A)$  is  $ii$ -closed.

**2.6 Lemma [5].** A subset  $A$  of a space  $X$  is  $gii$ -open in  $X$  if and only if  $F \subset ii-int(A)$  whenever  $F \subset A$  and  $F$  is closed in  $X$ .

#### 4. $ii$ -regular spaces.

**4.1 Definition.** A space  $X$  is said to be  **$ii$ -regular** (resp.  **$\alpha$ -regular** [1],  **$s$ -regular** [8],  **$\xi$ -regular** [11]) if for each closed set  $F$  of  $X$ , and each point  $x \in X - F$ , there exist disjoint  $ii$ -open (resp.  $\alpha$ -open,  $s$ -open,  $\xi$ -open) set  $U, V$  such that  $F \subset U$  and  $x \in V$ .

**4.2 Definition.** A space  $X$  is said to be **softly regular** [3] (resp. **almost regular** [12], **strongly  $rg$ -regular** [2]) if for every  $\pi$ -closed (resp. regular closed,  $rg$ -closed) set  $F$  of  $X$ , and a point  $x \in X - F$ , there exist disjoint open sets  $U$  and  $V$  such that  $F \subset U$  and  $x \in V$ .

**4.3 Definition.** A space  $X$  is said to be **weakly regular** [12] if for every point  $x$  and every regularly open set  $U$  containing  $x$ , there is an open set  $V$  such that  $x \in V \subset cl(V) \subset U$ .

**4.4 Theorem.** Every regular space is  $ii$ -regular.

**Proof.** Let  $X$  be a regular space. Let  $F$  be any closed set in  $X$  and a point  $x \in X$  such that  $x \notin F$ . Since  $X$  is a regular space, there exists a pair of disjoint sets  $U$  and  $V$  such that  $F \subset U$  and  $x \in V$ . Since we know that every open set is  $ii$ -open. So  $U$  and  $V$  are  $ii$ -open sets. Hence  $X$  is  $ii$ -regular.

**By the definitions stated above, we have the following diagram:**

Where none of the implications is reversible as can be seen from the following examples:

**4.5 Example.** Let  $X = \{a, b, c\}$  and  $\mathfrak{T} = \{\phi, \{a\}, \{b\}, \{a, b\}, X\}$ . Then the space  $(X, \mathfrak{T})$  is weakly regular. But it is neither almost regular nor softly regular.

**4.6 Example.** Let  $X = \{a, b, c, d\}$  and  $\mathfrak{T} = \{\phi, \{a\}, \{a, b\}, \{a, b, c\}, \{a, b, d\}, X\}$ . Then the space  $(X, \mathfrak{T})$  is almost regular but not strongly rg-regular.

**4.7 Example.** Let  $X = \{a, b, c\}$  and  $\mathfrak{T} = \{\phi, \{a\}, \{b\}, \{a, b\}, \{a, c\}, X\}$ . Then the space  $(X, \mathfrak{T})$  is regular.

**4.8 Example.** Let  $X = \{a, b, c\}$  and  $\mathfrak{T} = \{\phi, \{a\}, \{b, c\}, X\}$ . Then the space  $(X, \mathfrak{T})$  is regular but not strongly rg-regular. Since  $F = \{b\}$  is a rg-closed set such that  $c \notin \{b\}$ . We can not separate  $c$  and  $\{b\}$  by disjoint open sets.

**4.9 Theorem.** The following properties are equivalent for a space  $X$ :

- (a)  $X$  is ii-regular.
- (b) For each  $x \in X$  and each open set  $U$  of  $X$  containing  $x$ , there exists  $V \in \text{ii-O}(X)$  such that  $x \in V \subset \text{ii-cl}(V) \subset U$ .
- (c) For each closed set  $F$  of  $X$ ,  $\bigcap \{\text{ii-cl}(V) : F \subset V \in \text{ii-O}(X)\} = F$ .
- (d) For each subset  $A$  of  $X$  and each open set  $U$  of  $X$  such that  $A \cap U \neq \phi$ , there exists  $V \in \text{ii-O}(X)$  such that  $A \cap V \neq \phi$  and  $\text{ii-cl}(V) \subset U$ .
- (e) For each non empty subset  $A$  of  $X$  and each closed subset  $F$  of  $X$  such that  $A \cap F = \phi$ , there exist  $V, W \in \text{ii-O}(X)$  such that  $A \cap V \neq \phi, F \subset W$  and  $V \cap W = \phi$ .

**Proof.**

(a)  $\Rightarrow$  (b). Let  $U$  be an open set containing  $x$ , then  $X - U$  is closed in  $X$  and  $x \notin X - U$ . By (a), there exist  $W, V \in \text{ii-O}(X)$  such that  $x \in V, X - U \subset W$  and  $V \cap W = \phi$ . By **Lemma 2.5**, we have  $\text{ii-cl}(V) \cap W = \phi$  and hence  $x \in V \subset \text{ii-cl}(V) \subset U$ .

(b)  $\Rightarrow$  (c). Let  $F$  be a closed set of  $X$ . If  $F \subset V$ , then by **Lemma 2.5 (iii)**,  $\text{ii-cl}(F) \subset \text{ii-cl}(V)$  which gives  $F \subset \text{ii-cl}(V)$  as  $F \subset \text{ii-cl}(F)$ . Therefore,  $\bigcap \{\text{ii-cl}(V) : F \subset V \in \text{ii-O}(X)\} \supset F$ .

Conversely, let  $x \notin F$ . Then  $X - F$  is an open set containing  $x$ . By (b), there exists  $U \in \text{ii-O}(X)$  such that  $x \in U \subset \text{ii-cl}(U) \subset X - F$ . Put  $V = X - \text{ii-cl}(U)$ . By **Lemma 2.5**,  $F \subset V \in \text{ii-O}(X)$  and  $x \notin \text{ii-cl}(V)$ . This implies that  $\bigcap \{\text{ii-cl}(V) : F \subset V \in \text{ii-O}(X)\} \subset F$ .

Hence  $\bigcap \{\text{ii-cl}(V) : F \subset V \in \text{ii-O}(X)\} = F$ .

(c)  $\Rightarrow$  (d). Let  $A$  be a subset of  $X$  and let  $U$  be open in  $X$  such that  $A \cap U \neq \phi$ . Let  $x \in A \cap U$ , then  $X - U$  is a closed set not containing  $x$ . By (c), there exists  $W \in \text{ii-O}(X)$  such that  $X - U \subset W$  and  $x \notin \text{ii-cl}(W)$ . Put  $V = X - \text{ii-cl}(W)$ . Then  $V \subset X - W$ . Also  $x \in V \cap A$ . By using **Lemma 2.5**, we obtain  $V \in \text{ii-O}(X)$ , and  $\text{ii-cl}(V) \subset \text{ii-cl}(X - W) = X - W \subset U$ .

(d)  $\Rightarrow$  (e). Let  $A$  be a subset of  $X$  and let  $F$  be a closed set in  $X$  such that  $A \cap F = \phi$ , where  $A \neq \phi$ . Since  $X - F$  is open in  $X$  and  $A \neq \phi$ , by (d), there exists  $V \in \text{ii-O}(X)$  such that  $A \cap V \neq \phi$  and  $\text{ii-cl}(V) \subset X - F$ . Put  $W = X - \text{ii-cl}(V)$ , then  $F \subset W$ . Also,  $V \cap W = \phi$ . By **Lemma 2.5**,  $W \in \text{ii-O}(X)$ .

(e)  $\Rightarrow$  (a). This is obvious.

**4.10 Theorem.** A topological space  $(X, \mathfrak{T})$  is ii-regular if and only if for each closed set  $F$  of  $(X, \mathfrak{T})$  and each  $x \in X - F$ , there exist ii-open sets  $U$  and  $V$  of  $(X, \mathfrak{T})$  such that  $x \in U$  and  $F \subset V$  and  $\text{ii-cl}(U) \cap \text{ii-cl}(V) = \phi$ .

**Proof:** Let  $F$  be a closed set in  $(X, \mathfrak{T})$  and  $x \notin F$ . Then there exist ii-open sets  $U_x$  and  $V$  such that  $x \in U_x$ ,  $F \subset V$  and  $U_x \cap V = \phi$ . This implies that  $U_x \cap \text{ii-cl}(V) = \phi$ . Since  $\text{ii-cl}(V)$  is ii-closed and  $x \notin \text{ii-cl}(V)$ . Since  $(X, \mathfrak{T})$  is ii-regular, there exist ii-open sets  $G$  and  $H$  of  $(X, \mathfrak{T})$  such that  $x \in G$ ,  $\text{ii-cl}(V) \subset H$  and  $G \cap H = \phi$ . This implies  $\text{ii-cl}(G) \cap H = \phi$ . Take  $U = U_x \cap G$ . Then  $U$  and  $V$  are ii-open sets of  $(X, \mathfrak{T})$  such that  $x \in U$  and  $F \subset V$  and  $\text{ii-cl}(U) \cap \text{ii-cl}(V) = \phi$ , since  $\text{ii-cl}(U) \cap \text{ii-cl}(V) \subset \text{ii-cl}(G) \cap H = \phi$ . Conversely, suppose for each closed set  $F$  of  $(X, \mathfrak{T})$  and each  $x \in X - F$ , there exist ii-open sets  $U$  and  $V$  of  $(X, \mathfrak{T})$  such that  $x \in U$ ,  $F \subset V$  and  $\text{ii-cl}(U) \cap \text{ii-cl}(V) = \phi$ . Now  $U \cap V \subset \text{ii-cl}(U) \cap \text{ii-cl}(V) = \phi$ . Therefore  $U \cap V = \phi$ . Thus  $(X, \mathfrak{T})$  is ii-regular.

**4.11 Definition.** A space  $X$  is said to be **ii-T<sub>3</sub> space** if it is ii-regular as well as ii-T<sub>1</sub> space.

**4.12 Theorem.** Every ii-T<sub>3</sub> space is an ii-T<sub>2</sub> space.

**Proof.** Let  $X$  be ii-T<sub>3</sub>, so it is both ii-T<sub>1</sub> and ii-regular. Also  $X$  is ii-T<sub>1</sub>  $\Rightarrow$  every singleton subset  $\{x\}$  of  $X$  is an ii-closed. Let  $\{x\}$  be an ii-closed subset of  $X$  and  $y \in X - \{x\}$ . Then we have  $x \neq y$  since  $X$  is ii-regular, there exist disjoint ii-open sets  $U$  and  $V$  such that  $\{x\} \subset U$ ,  $y \in V$ , and such that  $U \cap V = \phi$  (or)  $U$  and  $V$  are disjoint ii-open sets containing  $x$  and  $y$  respectively. Since  $x$  and  $y$  are arbitrary, for every pair of distinct points, there exist disjoint ii-open sets. Hence  $X$  is ii-T<sub>2</sub> space.

**4.13 Theorem.** Every subspace of an ii-regular space is ii-regular.

**Proof.** Let  $X$  be an ii-regular space. Let  $Y$  be a subspace of  $X$ . Let  $x \in Y$  and  $F$  be a closed set in  $Y$  such that  $x \notin F$ . Then there is a closed set  $A$  of  $X$  with  $F = Y \cap A$  and  $x \notin A$ . Since  $X$  is ii-regular, there exist disjoint ii-open sets  $U$  and  $V$  such that  $x \in U$  and  $A \subset V$ . Note that  $Y \cap U$  and  $Y \cap V$  are ii-open sets in  $Y$ . Also  $x \in U$  and  $x \in Y$ , which implies  $x \in Y \cap U$  and  $A \subset V$  implies  $Y \cap U \subset Y \cap V$ ,  $F \subset Y \cap V$ . Also,  $(Y \cap U) \cap (Y \cap V) = \phi$ . Hence  $Y$  is ii-regular space.

**4.14 Theorem.** Every ii-compact Hausdorff space is an ii-T<sub>3</sub> space and hence an ii-regular space.

**Proof.** Let  $(X, \mathfrak{T})$  be a compact Hausdorff space, that is an ii-T<sub>3</sub> space. But every ii-T<sub>2</sub> space is ii-T<sub>1</sub>. To prove that it is ii-T<sub>3</sub> space it is sufficient to prove that it is ii-regular. Let  $F$  be a closed subset of  $X$ , and  $x \notin F$ . Now  $x \in X - F$  so that any point  $y \in F$  is a point of  $X$  which is different from  $x$ . Since  $(X, \mathfrak{T})$  is an ii-T<sub>2</sub> space corresponding to  $x$  and  $y$ , there exists two ii-open sets  $H_y$  and  $G_y$  such that  $G_y \cap H_y = \phi$  where  $x \in H_y$  and  $y \in G_y$ . Now let  $\mathfrak{T}^*$  denote the relative topology for  $F$  so that the collection  $C^* = \{F \cap H_y : y \in F\}$  is an ii- $\mathfrak{T}^*$  open cover of  $F$ . But  $F$  is closed and since  $(X, \mathfrak{T})$  is ii-compact  $(F, \mathfrak{T}^*)$  is also ii-compact. Hence a finite subcover of  $F$  (or) there exist points  $y_1, y_2, \dots, y_n$  in  $F$  such that  $C^* = \{F \cap H_{y_i} : i = 1, 2, \dots, n\}$  is a finite sub cover for  $F$ . Now  $F = \cup \{F \cap H_{y_i} : i = 1, 2, \dots, n\}$  or  $F = F \cap \{\cup \{H_{y_i} : i = 1, 2, \dots, n\}\}$

Hence  $F \subset \cup \{H_{y_i} : i = 1, 2, \dots, n\}$  or  $F \subset H$  where  $H = \cup \{H_{y_i} : i = 1, 2, \dots, n\}$  is ii-open set containing  $H$ , being the union of ii-open sets. Again  $G_{y_i}$  for  $i = 1, 2, 3, \dots, n$  is ii-open set containing  $x$  and hence  $G = \cap \{G_{y_i} : i = 1, 2, \dots, n\}$  is also an ii-open set containing  $x$ .

Also  $G \cap H = \phi$ , otherwise  $G_{y_i} \cap H_{y_i} \neq \phi$  for some  $i$ . Hence corresponding to each closed set  $F$  and an element  $x$  in  $X - F$  we have two ii-open sets  $G$  and  $H$  such that  $x \in G$ ,  $F \subset H$  and  $G \cap H = \phi$ . Hence  $(X, \mathfrak{T})$  is ii-regular. Since it is ii-T<sub>2</sub> so ii-T<sub>1</sub> and hence  $(X, \mathfrak{T})$  ii-T<sub>3</sub>.

**5. Some related functions with ii-regular spaces**

**5.1 Definition.** A function  $f : X \rightarrow Y$  is said to be **ii-closed** [4] if for each closed set  $F$  of  $X$ ,  $f(F)$  is ii-closed in  $Y$ .

**5.2 Definition.** A function  $f : X \rightarrow Y$  is said to be

- (i) **generalized ii-closed** [5] (briefly **gii-closed**) if for each closed set  $F$  of  $X$ ,  $f(F)$  is gii-closed in  $Y$ .
- (ii) **ii-generalized ii-closed** [5] (briefly **ii-gii-closed**) if for each ii-closed set  $F$  of  $X$ ,  $f(F)$  is gii-closed in  $Y$ .

**5.3 Remark.** Every closed function is ii-closed but not conversely. Also, every ii-closed function is gii-closed because every ii-closed set is gii-closed. It is obvious that both ii-closedness and ii-gii-closedness imply gii-closedness.

**5.4 Theorem.** A surjective function  $f : X \rightarrow Y$  is gii-closed (resp. ii-gii-closed) if and only if for each subset  $B$  of  $Y$  and each open (resp. ii-open) set  $U$  of  $X$  containing  $f^{-1}(B)$ , there exists a gii-open set  $V$  of  $Y$  such that  $B \subset V$  and  $f^{-1}(V) \subset U$ .

**Proof.** Suppose that  $f$  is gii-closed (resp. ii-gii-closed). Let  $B$  be any subset of  $Y$  and  $U$  be open (resp. ii-open) set of  $X$  containing  $f^{-1}(B)$ . Put  $V = Y - f(X - U)$ . Then the complement  $V^c$  of  $V$  is  $V^c = Y - V = f(X - U)$ . Since  $X - U$  is closed in  $X$  and  $f$  is gii-closed,  $f(X - U) = V^c$  is gii-closed. Therefore,  $V$  is gii-open in  $Y$ . It is easy to see that  $B \subset V$  and  $f^{-1}(V) \subset U$ .

Conversely, let  $F$  be a closed (resp. ii-closed) set of  $X$ . Put  $B = Y - f(F)$ , then we have  $f^{-1}(B) \subset X - F$  and  $X - F$  is open (resp. ii-open) in  $X$ . Then by assumption, there exists a gii-open set  $V$  of  $Y$  such that  $B = Y - f(F) \subset V$  and  $f^{-1}(V) \subset X - F$ . Now  $f^{-1}(V) \subset X - F$  implies  $V \subset Y - f(F) = B$ . Also  $B \subset V$  and so  $B = V$ . Therefore, we obtain  $f(F) = Y - V$  and hence  $f(F)$  is gii-closed in  $Y$ . This shows that  $f$  is gii-closed (resp. ii-gii-closed).

**5.5 Remark.** We can prove the necessity part of the above theorem by replacing each set to closed set in the form of the proposition given below:

**5.6 Proposition.** If a surjective function  $f : X \rightarrow Y$  is gii-closed (resp. ii-gii-closed) then for a closed set  $F$  of  $Y$  and for any open (resp. ii-open) set  $U$  of  $X$  containing  $f^{-1}(F)$ , there exists an ii-open set  $V$  of  $Y$  such that  $F \subset V$  and  $f^{-1}(V) \subset U$ .

**Proof.** By **Theorem 5.4**, there exists a gii-open set  $W$  of  $Y$  such that  $F \subset W$  and  $f^{-1}(W) \subset U$ . Since  $F$  is closed, by **Lemma 2.6** we have  $F \subset \text{ii-int}(W)$ . Put  $V = \text{ii-int}(W)$ . Then  $V \in \text{ii-O}(Y)$ ,  $F \subset V$  and  $f^{-1}(V) \subset U$ .

**5.7 Proposition.** If  $f : X \rightarrow Y$  is continuous ii-gii-closed and  $A$  is gii-closed in  $X$ , then  $f(A)$  is gii-closed in  $Y$ .

**Proof.** Let  $V$  be a open set of  $Y$  containing  $f(A)$ . Then  $A \subset f^{-1}(V)$ . Since  $f$  is continuous,  $f^{-1}(V)$  is open in  $X$ . Since  $A$  is gii-closed in  $X$ , by a definition, we get  $\text{ii-c1}(A) \subset f^{-1}(V)$  and hence  $f(\text{ii-c1}(A)) \subset V$ . Since  $f$  is ii-gii-closed and  $\text{ii-c1}(A)$  is ii-closed in  $X$ ,  $f(\text{ii-c1}(A))$  is gii-closed in  $Y$  and hence we have  $\text{ii-c1}(f(\text{ii-c1}(A))) \subset V$ . By definition of the ii-closure of a set,  $A \subset \text{ii-c1}(A)$  which implies  $f(A) \subset f(\text{ii-c1}(A))$  and using **Lemma 2.5**,  $\text{ii-c1}(f(A)) \subset \text{ii-c1}(f(\text{ii-c1}(A))) \subset U$ . That is  $\text{ii-c1}(f(A)) \subset U$ . This shows that  $f(A)$  is gii-closed in  $Y$ .

**5.8 Definition.** A function  $f : X \rightarrow Y$  is said to be **ii-irresolute** [4] if for each  $V \in \text{ii-O}(Y)$ ,  $f^{-1}(V) \in \text{ii-O}(X)$ .

**5.9 Proposition.** If  $f : X \rightarrow Y$  is an open ii-irresolute bijection and  $B$  is gii-closed in  $Y$ , then  $f^{-1}(B)$  is gii-closed in  $X$ .

**Proof.** Let  $U$  be a open set of  $X$  containing  $f^{-1}(B)$ . Then  $B \subset f(U)$  and  $f(U)$  is open in  $Y$ . Since  $B$  is gii-closed in  $Y$ ,  $\text{ii-c1}(B) \subset f(U)$  and hence we have  $f^{-1}(\text{ii-c1}(B)) \subset U$ . Since  $f$  is ii-irresolute,  $f^{-1}(\text{ii-c1}(B))$  is ii-closed in  $X$  (**Theorem 2.5** (i) and (v)), we have  $\text{ii-c1}(f^{-1}(B)) \subset f^{-1}(\text{ii-c1}(B)) \subset U$ . This shows that  $f^{-1}(B)$  is gii-closed in  $X$ .

**5.10 Theorem.** Let  $f : X \rightarrow Y$  and  $h : Y \rightarrow Z$  be the two functions, then

- (i) If  $h \circ f : X \rightarrow Z$  is gii-closed and if  $f : X \rightarrow Y$  is a continuous surjection, then  $h : X \rightarrow Z$  is gii-closed .
- (ii) If  $f : X \rightarrow Y$  is gii-closed with  $h : Y \rightarrow Z$  is continuous and ii-gii-closed, then  $h \circ f : X \rightarrow Z$  is gii-closed.
- (iii) If  $f : X \rightarrow Y$  is closed and  $h : Y \rightarrow Z$  is gii-closed, then  $h \circ f : X \rightarrow Z$  is gii-closed.

**Proof.**

- (i) Let  $F$  be a closed set of  $Y$ . Then  $f^{-1}(F)$  is closed in  $X$  since  $f$  is continuous. By hypothesis  $(h \circ f)$   $(f^{-1}(F))$  is gii-closed in  $Z$ . Hence  $h$  is gii-closed.
- (ii) The proof follows from the **Proposition 5.7**.
- (iii) The proof is obvious from definitions.

**5.11 Theorem.** The following properties are equivalent for a space  $X$  :

- (a)  $X$  is ii-regular.
- (b) For each closed set  $F$  and each point  $x \in X - F$ , there exists  $U \in \text{ii-O}(X)$  and a gii-open set  $V$  such that  $x \in U$  and  $F \subset V$  and  $U \cap V = \phi$ .
- (c) For each subset  $A$  of  $X$  and each closed set  $F$  such that  $A \cap F = \phi$ , there exist  $U \in \text{ii-O}(X)$  and a gii-open set  $V$  such that  $A \cap U \neq \phi$ ,  $F \subset V$  and  $U \cap V = \phi$ .
- (d) For each closed set  $F$  of  $X$ ,  $F = \cap \{ \text{ii-cl}(V) : F \subset V \text{ and } V \text{ is gii-open} \}$ .

**Proof.**

- (a)  $\Rightarrow$  (b). The proof is obvious since every ii-open set is gii-open.
- (b)  $\Rightarrow$  (c). Let  $A$  be a subset of  $X$  and let  $F$  be a closed set in  $X$  such that  $A \cap F = \phi$ . For a point  $x \in A$ ,  $x \in X - F$  and hence there exists  $U \in \text{ii-O}(X)$  and a gii-open set  $V$  such that  $x \in U$  and  $F \subset V$  and  $U \cap V = \phi$ . Also  $x \in A$ ,  $x \in U$  implies  $x \in A \cap U$ . So  $A \cap U \neq \phi$ .
- (c)  $\Rightarrow$  (a). Let  $F$  be a closed set and let  $x \in X - F$ . Then,  $\{x\} \cap F = \phi$  and there exist  $U \in \text{ii-O}(X)$  and a gii-open set  $W$  such that  $x \in U$ ,  $F \subset W$  and  $U \cap W = \phi$ . Put  $V = \text{ii-int}(W)$ , then by **Lemma 2.6**, we have  $F \subset V$ ,  $V \in \text{ii-O}(X)$  and  $U \cap V = \phi$ . Therefore  $X$  is ii-regular.

(a)  $\Rightarrow$  (d). For a closed set  $F$  of  $X$ , by **Theorem 4.9**, we obtain

$$F \subset \cap \{ \text{ii-cl}(V) : F \subset V \text{ and } V \text{ is gii-open} \}$$

$$\subset \cap \{ \text{ii-cl}(V) : F \subset V \text{ and } V \in \text{ii-O}(X) \} = F$$

Therefore,  $F = \cap \{ \text{ii-cl}(V) : F \subset V \text{ and } V \text{ is gii-open} \}$ .

(d)  $\Rightarrow$  (a). Let  $F$  be a closed set of  $X$  and  $x \in X - F$ . by (d), there exists a gii-open set  $W$  of  $X$  such that  $F \subset W$  and  $x \in X - \text{ii-cl}(W)$ . Since  $F$  is closed,  $F \subset \text{ii-int}(W)$  by **Lemma 2.6**. Put  $V = \text{ii-int}(W)$ , then  $F \subset V$  and  $V \in \text{ii-O}(X)$ . Since  $x \in X - \text{ii-cl}(W)$ ,  $x \in X - \text{ii-cl}(V)$ . Put  $U = X - \text{ii-cl}(V)$  then,  $x \in U$ ,  $U \in \text{ii-O}(X)$  and  $U \cap V = \phi$ . This shows that  $X$  is ii-regular.

**5.12 Definition.** A function  $f : X \rightarrow Y$  is said to be **ii-open** if for each open set  $U$  of  $X$ ,  $f(U) \in \text{ii-O}(Y)$ .

**5.13 Theorem.** If  $f : X \rightarrow Y$  is a continuous ii-open gii-closed surjection and  $X$  is regular, then  $Y$  is ii-regular.

**Proof.** Let  $y \in Y$  and let  $V$  be an open set of  $Y$  containing  $y$ . Let  $x$  be a point of  $X$  such that  $y = f(x)$ . By the regularity of  $X$ , there exists an open set  $U$  of  $X$  such that  $x \in U \subset \text{cl}(U) \subset f^{-1}(V)$ . We have  $y \in f(U) \subset f(\text{cl}(U)) \subset V$ . since  $f$  is ii-open and gii-closed,  $f(U) \in \text{ii-O}(Y)$  and  $f(\text{cl}(U))$  is gii-closed in  $Y$ . So, we obtain,  $y \in f(U) \subset \text{ii-cl}(f(U)) \subset \text{ii-cl}(f(\text{cl}(U))) \subset V$ . It follows from **Theorem 5.11** that  $Y$  is ii-regular.

**5.14 Definition.** A function  $f : X \rightarrow Y$  is said to be **pre ii-open [5]** if for each ii-open set  $U$  of  $X$ ,  $f(U) \in \text{ii-O}(Y)$ .

**5.15 Theorem.** If  $f : X \rightarrow Y$  is a continuous pre ii-open ii-gii-closed surjection and  $X$  is ii-regular, then  $Y$  is ii-regular.

**Proof.** Let  $F$  be any closed set of  $Y$  and  $y \in Y - F$ . Then  $f^{-1}(Y) \cap f^{-1}(F) = \phi$  and  $f^{-1}(F)$  is closed in  $X$ . Since  $X$  is ii-regular, for a point  $x \in f^{-1}(y)$ , there exist  $U, V \in \text{ii-O}(X)$  such that  $x \in U, f^{-1}(F) \subset V$  and  $U \cap V = \phi$ . Since  $F$  is closed in  $Y$ , by **Proposition 5.6**, there exists  $W \in \text{ii-O}(Y)$  such that  $F \subset W$  and  $f^{-1}(W) \subset V$ . Since  $f$  pre ii-open, we have  $y = f(x) \in f(U)$  and  $f(U) \in \text{ii-O}(Y)$ . Since  $U \cap V = \phi, f^{-1}(W) \cap U = \phi$  and hence  $W \cap f(U) = \phi$ . This shows that  $Y$  is ii-regular.

### 6. Conclusion

In this paper, we introduce and study a new class of spaces, namely ii-regular spaces by using ii-open sets. The relationships among regular, strongly rg-regular, almost regular, softly regular, weakly regular,  $\alpha$ -regular, s-regular and ii-regular spaces are investigated. Also we obtained some characterizations of ii-regular spaces, properties of the forms of gii-closed, iig-closed functions and preservation theorems for ii-regular spaces. Of course, the entire content will be a successful tool for the researchers for finding the way to obtain the results in the context of such types of regular spaces.
