**Abstract** - Graphs are simple model of relation. It is a convenient way of representing information involving relationship between objects. In this chapter, we discussed the concept some operations such as null anti-fuzzy graph and the relationship between complete anti fuzzy graph and strong anti-fuzzy graphs are discussed. Suitable example is illustrated to demonstrate the null identity fuzzy graph.

**Keywords:** - Anti-fuzzy graph, strong anti-fuzzy graph, complete anti-fuzzy graph, null anti fuzzy graph.

## I. INTRODUCTION

Zadeh [12] introduced fuzzy sets in 1965 to represent/manipulate data and information possessing non-statistical uncertainties. It was, particularly, designed to mathematically represent uncertainty and vagueness and to provide formalized tools for dealing with the imprecision intrinsic to many problems. But it was Rosenfeld [10] who considered fuzzy relations on fuzzy sets and developed the theory of fuzzy graphs in 1975. Rosenfeld has obtained the fuzzy analogues of several basic graph-theoretic concepts like bridges, paths, cycles, trees and connectedness and established some of their properties. There are several operations on  $G_1$  and  $G_2$  which result in a graph  $G$  whose set of points. These include the Cartesian product, the composition and the tensor product. Other operations of this form are developed in Harary and Wilcox [3] and they investigated some invariant properties of them. Operations on (crisp) graphs such as conjunction, disjunction, rejection and symmetric difference were extended to fuzzy graphs and a methodology is proposed to find the resulting fuzzy graphs of the same operations using adjacency matrices of  $G_1$  and  $G_2$  [7]. Bhutani [1] introduced the notion of weak isomorphism and isomorphism between fuzzy graphs. Nagoorgani and Malarvizhi [8] discussed the order, size and degree of the vertices of the isomorphic fuzzy graphs. Nagoorgani and Latha [6] introduced neighbourly irregular fuzzy graphs and highly irregular fuzzy graphs and a comparative study between them had been analysed. In this chapter, we discussed the concept some operations such as null - identity anti fuzzy graph and the relationship between complete anti-fuzzy graph and strong anti-fuzzy graphs are discussed. We derived some theorem and example on them.

## II. PRELIMINARIES

### DEFINITION: 2.1

Let  $G$  be a simple fuzzy graph  $M$  of  $G$  is called anti fuzzy graph such that  $M(x,y) \leq S(x)S(y), \forall (x,y) \in G$  An anti-fuzzy graph  $AfG = (S, M)$  over the set  $V$  is called **strong anti-fuzzy graph** if  $M(x,y) \leq S(x)S(y), \forall (x,y) \in G$

**DEFINITION: 2.2**

An anti-fuzzy graph  $G_A = (\sigma, \mu)$  is a strong anti-fuzzy graph if  $\mu(u, v) = \sigma(u) \vee \sigma(v), \forall (u, v) \in \mu^*$ , and is a complete anti fuzzy graph if  $\mu(u, v) = \sigma(u) \vee \sigma(v), \forall (u, v) \in \sigma^*$ . Two nodes  $u$  and  $v$  are said to be neighbours if  $\mu(u, v) > 0$ .

**DEFINITION: 2.3**

Let  $G$  be simple graph, the anti-fuzzy graph  $AFI \in AF, (V, E)$  is called **identity anti-fuzzy graph** such that denoted by  $I$ - if  $AFI(e) = 1, \forall e \in E$ .

**DEFINITION: 2.4**

An IFG  $G: (V, E)$  is said to be a **strong IFG** if  $\mu_2(v_i, v_j) = \min(\mu_1(v_i), \mu_1(v_j))$  and  $v_2(v_i, v_j) = \max(v_1(v_i), v_1(v_j)), \forall (v_i, v_j) \in E$ .

**III. OPERATIONS OF ANTI FUZZY GRAPH**

**DEFINITION 3.1**

Consider an anti join  $G_A^* = G_{A1}^* + G_{A2}^* = (v_1 \cup v_2, E_1 \cup E_2 \cup E')$  of anti fuzzy graphs where  $E'$  is the set of all edges joining the vertices of  $V_1$  and  $V_2$  where we assume that  $V_1 \cap V_2 = \emptyset$ . Then the anti join of anti fuzzy graphs  $G_{A1}$  and  $G_{A2}$  is an anti fuzzy graph  $G_A = G_{A1} + G_{A2} : (\sigma_1 + \sigma_2, \mu_1 + \mu_2)$  is defined by

$$\begin{aligned} \sigma_1 + \sigma_2(u) &= \sigma_1 \cup \sigma_2(u) \text{ if } u \in V_1 \cup V_2 \\ \mu_1 + \mu_2(u, v) &= \mu_1 \cup \mu_2(u, v) \text{ if } (u, v) \in E_1 \cup E_2 \\ \mu_1 + \mu_2(u, v) &= \max\{\sigma_1(u), \sigma_2(v)\} \text{ if } (u, v) \in E' \end{aligned}$$

**DEFINITION: 3.2**

Let  $G$  be a simple graph let  $AfH = (S_i, M_i)$  and  $AfG = (S, M)$  is two anti-fuzzy graph over set  $v$  then  $AfH$  is called anti fuzzy sub-graph of anti-fuzzy graph such that

$$S_i(x) \leq S(x) M_i(x, y) \leq M(x, y) \forall (x, y) \in AfG$$

Now we define null-identity anti fuzzy graph.

**EXAMPLE: 3.1**

Let  $= [v_1, v_2, v_3, v_4]$  and  $E = [e_1, e_2, e_3, e_4]$ . Here anti fuzzy graph  $AfG$  such that

$$M(x, y) = \begin{cases} 0 & \text{if } v_i \text{ is not end of } e_i \\ 1 & \text{if } v_i \text{ is end of } e_i \end{cases}$$

$$V(x_i, x_j = 1, \forall (x_i, x_j) \in V) \text{ while } V(x_i, x_j) = i, \\ i = 2, 3, 4, 5, \forall (x_i, x_j) \notin V$$

In the following graph  $G_1$  and  $G_2$

Of the graph  $G_1$  we apply Anti fuzzy graph

$$M(v_1, v_2) = 1 \text{ and } S(v_1)S(v_2) = 1$$

$$\text{Then } M(v_1, v_2) \leq S(v_1)S(v_2)$$

$$M(v_1, v_2) = 2$$

$$S(v_1) = 1, S(v_3) = 3$$

$$\text{Then } M(v_1, v_3) \leq S(v_1)S(v_3)$$

$$\text{If } M(v_3, v_4) = 3$$

$$S(v_3) = 3, S(v_4) = 4$$

$$M(v_3, v_4) \leq S(v_3)S(v_4)$$

$$\text{If } M(v_2, v_4) = 4$$

$$S(v_2) = 1, S(v_4) = 4$$

$$\text{Then } M(v_2, v_4) \leq S(v_2)S(v_4)$$

Of the graph  $G_2$  we apply Anti fuzzy graph

$$M(v_1, v_2) = 2 \text{ and } S(v_1) = 2, S(v_2) = 3$$

$$\text{such that } S(v_1)S(v_2) = 6$$

$$\text{Then } M(v_1, v_2) \leq S(v_1)S(v_2)$$

$$\text{If } M(v_1, v_3) = 4$$

$$S(v_1) = 2, S(v_3) = 4$$

$$\text{Then } M(v_1, v_3) \leq S(v_1)S(v_3)$$

$$\text{If } M(v_3, v_4) = 5$$

$$S(v_3) = 4, S(v_4) = 5$$

$$\text{Then } M(v_3, v_4) \leq S(v_3)S(v_4)$$

$$\text{If } M(v_2, v_4) = 3$$

$$S(v_2) = 3, S(v_4) = 5$$

$$\text{Then } M(v_2, v_4) \leq S(v_2)S(v_4)$$

**THEOREM: 3.1**

If  $G_1: (\sigma_1, \mu_1)$  and  $G_2: (\sigma_2, \mu_2)$  are complete anti fuzzy graphs, then  $G_1 \oplus G_2$  is a strong anti-fuzzy graph.

**PROOF:**

Let  $G_1 \oplus G_2 = G = (\sigma, \mu)$  where  $\sigma = \sigma_1 \oplus \sigma_2$  and  $\mu = \mu_1 \oplus \mu_2$  and

$G: (V, X)$  where  $V = V_1 \times V_2$  and

$$X = \left\{ \left\{ (u_1, v_1), (u_1, v_2) \right\} / (u_1 \in V_1, (v_1, v_2) \in X_2) \cup \left\{ \left\{ (u_1, v_1), (u_2, v_1) \right\} \right. \right. \\ \left. \left. / (v_1 \in V_2, (u_1, u_2) \in X_1) \right. \right. \\ \left. \cup \left\{ \left\{ (u_1, v_1), (u_2, v_2) \right\}, u_1, u_2 \in V_1, u_1 \neq u_2, v_1, v_2 \in V_2, v_1 \neq v_2 \right. \right. \\ \left. \left. \text{Either } \{ (u_1, u_2) \in X_1 \text{ or } (v_1, v_2) \in X_2 \} \right. \right.$$

Either  $\{ (u_1, u_2) \in X_1 \text{ or } (v_1, v_2) \in X_2 \}$

**CASE (i):**

Let  $e = ((u_1, v_1), (u_1, v_2)), \forall u_1 \in V_1, (v_1, v_2) \in X_2$

Then,

$$(\mu_1 \oplus \mu_2)((u_1, v_1), (u_1, v_2)) = \min\{\sigma_1(u_1), \mu_2(v_1, v_2)\} \\ = \sigma_1(u_1) \vee [\sigma_2(v_1) \vee \sigma_2(v_2)]$$

Since  $G_2$  is a complete anti fuzzy graph.

$$= [\sigma_1(u_1) \vee \sigma_2(v_1)] \vee [\sigma_1(u_1) \vee \sigma_2(v_2)]$$

$$= (\sigma_1 \oplus \sigma_2)(u_1, v_1) \vee (\sigma_1 \oplus \sigma_2)(u_1, v_2)$$

**CASE (ii):**

Let  $e = ((u_1, v_1), (u_2, v_1)), \forall v_1 \in V_2, (u_1, u_2) \in X_1$

Then,

$$(\mu_1 \oplus \mu_2)((u_1, v_1), (u_2, v_1)) = \min\{\sigma_2(v_1), \mu_1(u_1, u_2)\} \\ = \sigma_2(v_1) \vee [\sigma_1(u_1) \vee \sigma_1(u_2)]$$

Since  $G_1$  is a complete anti fuzzy graph.

$$= [\sigma_1(u_1) \vee \sigma_2(v_1)] \vee [\sigma_1(u_2) \vee \sigma_2(v_1)]$$

$$= (\sigma_1 \oplus \sigma_2)(u_1, v_1) \vee (\sigma_1 \oplus \sigma_2)(u_2, v_1)$$

**CASE (iii):**

Let  $e = ((u_1, v_1), (u_2, v_2)), \forall u_1, u_2 \in V_1, (v_1, v_2) \in V_2$

a) Suppose  $(u_1, u_2) \notin X_1$  and  $(v_1, v_2) \in X_2$

Then,

$$\begin{aligned} (\mu_1 \oplus \mu_2)((u_1, v_1), (u_2, v_2)) &= \min\{\sigma_1(u_1), \sigma_1(u_2)\mu_2(v_1, v_2)\} \\ &= \sigma_1(u_1) \vee \sigma_1(u_2) \vee \{\sigma_2(v_1), \sigma_2(v_2)\} \end{aligned}$$

Since  $G_2$  is a complete anti fuzzy graph.

$$\begin{aligned} &= [\sigma_1(u_1) \vee \sigma_2(v_1)] \vee [\sigma_1(u_2) \vee \sigma_2(v_2)] \\ &= (\sigma_1 \oplus \sigma_2)(u_1, v_1) \vee (\sigma_1 \oplus \sigma_2)(u_2, v_2) \end{aligned}$$

b) Suppose  $(u_1, u_2) \in X_1$  and  $(v_1, v_2) \notin X_2$

Then,

$$\begin{aligned} (\mu_1 \oplus \mu_2)((u_1, v_1), (u_2, v_2)) &= \min\{\sigma_2(v_1), \sigma_2(v_2), \mu_1(u_1, u_2)\} \\ &= \sigma_2(v_1) \vee \sigma_2(v_2) \vee \{\sigma_1(u_1), \sigma_1(u_2)\} \end{aligned}$$

Since  $G_1$  is a complete anti fuzzy graph.

$$\begin{aligned} &= [\sigma_1(u_1) \vee \sigma_2(v_1)] \vee [\sigma_1(u_2) \vee \sigma_2(v_2)] \\ &= (\sigma_1 \oplus \sigma_2)(u_1, v_1) \vee (\sigma_1 \oplus \sigma_2)(u_2, v_2) \end{aligned}$$

Thus in all cases, it is true that  $G_1 \oplus G_2$  is a strong anti-fuzzy graph.
