#### Abstract

A graph $G$ with $p$ vertices and $q$ edges is called a harmonic mean graph if it is possible to label the vertixnodes $\mathrm{x} \in \mathrm{V}$ with distinct labels $\mathrm{f}(\mathrm{x})$ from $\{1,2, \ldots . . \mathrm{q}+1\}$ in such a way that each edge $\mathrm{e}=\mathrm{uv}$ is labeled with $\mathrm{f}(\mathrm{uv})=\left\lceil\frac{2 f(u) f(v)}{f(u)+f(v)}\right\rceil$ (or) $\left\lfloor\left.\frac{2 f(u) f(v)}{f(u)+f(v)} \right\rvert\,\right.$ then the edge labels are distinct. In this case f is called Harmonic mean labeling of $G$. In this paper we prove that some families of graphs such as zig-zag triangle of

 $\mathrm{Z}\left(T_{n}\right) \odot K_{1}, \mathrm{Z}\left(T_{n}\right) \odot \overline{K_{2}}, \mathrm{Z}\left(T_{n}\right) \odot K_{2}$, are harmonic mean graphs.

## Introduction

Let $\mathrm{G}=(\mathrm{V}, \mathrm{E})$ be a $(\mathrm{p}, \mathrm{q})$ graph with $\mathrm{p}=|\mathrm{V}(\mathrm{G})|$ vertices and $\mathrm{q}=|\mathrm{E}(\mathrm{G})|$ edges, where $\mathrm{V}(\mathrm{G})$ and $\mathrm{E}(\mathrm{G})$ respectively denote the vertex set and edge set of the graph $G$. In this paper, we refer the graphs which are simple, finite and undirected. Harary's graph theory used for theoretic terminology and notations [3].

The concept of graph labeling was introduced by Rosa in 1967. A detailed survey of graph labeling is available in Gallian[2]. S.Somasundaram, R.Ponraj and S.S.Sandhya were introduced the concept of harmonic mean labeling of graphs. They investigated the existence of harmonic mean labeling of several family of graphs studied by several authors. We have proved Harmonic mean labeling of subdivision graphs such as $P_{n} \odot K_{1}, P_{n} \odot \overline{K_{2}}, \mathrm{H}$-graph, crown, $C_{n} \odot K_{1}, C_{n} \odot \overline{K_{2}}$, quadrilateral snake, Triangular snake and also proved Harmonic mean labeling of some graphs such as Triple triangular snake $\mathrm{T}\left(T_{n}\right)$, Alternate Triple triangular snake $\mathrm{A}\left[\mathrm{T}\left(T_{n}\right)\right]$, Triple quadrilateral snake $\mathrm{T}\left(Q_{n}\right)$, Alternate Triple quadrilateral snake $\mathrm{A}\left[\mathrm{T}\left(Q_{n}\right)\right]$, T wig graph $\mathrm{T}(\mathrm{n})$, balloon
triangular snake $T_{n}\left(C_{m}\right)$, and key graph $\mathrm{Ky}(\mathrm{m}, \mathrm{n}),[6,7]$. The following definitions are useful for the present investigation.
Notations:
$\lfloor x\rfloor$ - Largest integer less than or equal to x .

## Definition: 1.1 [8]

A Graph $G=(V, E)$ with $p$ points and $q$ lines is called a Harmonic mean graph if it is possible to label the points $v \in \mathrm{~V}$ with distinct labels $\mathrm{f}(\mathrm{v})$ from $\{1,2, \ldots, \mathrm{q}+1\}$ in such a way that when each line $\mathrm{e}=\mathrm{uv}$ is labeled with $\mathrm{f}(\mathrm{uv})=\left\lceil\frac{2 f(u) f(v)}{f(u)+f(v)}\right\rceil$ (or) $\left\lfloor\frac{2 f(u) f(v)}{f(u)+f(v)}\right\rfloor$ then the resulting edge labels are distinct. In this case f is called Harmonic mean labeling of G .

## Definition:1.2 [4]

Let $G$ be the graph obtained from the path $P_{n}=\mathrm{x}_{1}, \mathrm{x}_{2}, \ldots \mathrm{x}_{\mathrm{n}}$ adding a new vertex point $\mathrm{y}_{1}, \mathrm{y}_{2}, \ldots \mathrm{y}_{\mathrm{n}}$ and new edge $\operatorname{liney}_{1} \mathrm{x}_{2}, \mathrm{y}_{\mathrm{n}} \mathrm{x}_{\mathrm{n}-1} ; \mathrm{x}_{\mathrm{i}} \mathrm{y}_{\mathrm{i}}$ for $1 \leq i \leq n, \mathrm{y}_{\mathrm{i}} \mathrm{x}_{\mathrm{i}-1}, \mathrm{y}_{\mathrm{i}} \mathrm{x}_{\mathrm{i}+1}$, for $2 \leq i \leq n$-1.The resultant graph is called zig-zag triangle $\mathrm{Z}\left(T_{n}\right)$.

In this paper we prove that zig-zag triangle $\mathrm{Z}\left(T_{n}\right) \odot K_{1}, \mathrm{Z}\left(T_{n}\right) \odot \overline{K_{2}}, \mathrm{Z}\left(T_{n}\right) \odot K_{2}$, are harmonic mean graphs.

## II. Harmonic mean labeling of graphs

## Theorem:2.1

The zig-zag triangle $\mathrm{Z}\left(T_{n}\right) \odot K_{1}$ is a harmonic mean graph.

## Proof:

Let $\mathrm{x}_{1}, \mathrm{x}_{2}, \ldots, \mathrm{x}_{\mathrm{n}}$ be the vertices of the path $P_{n}$ and let $\mathrm{G}=\mathrm{Z}\left(T_{n}\right)$ be the zig-zag triangle graph.

Let $\mathrm{V}(\mathrm{G})=\left\{x_{i} \mathrm{y}_{\mathrm{i}} / 1 \leq i \leq n\right\}$ and
$\mathrm{E}(\mathrm{G})=\left\{y_{i} x_{i-1}, y_{i} x_{i+1} / 2 \leq i \leq n-1\right\} \cup\left\{y_{i} x_{i} / 1 \leq i \leq n\right\} \cup\left\{y_{1} x_{2}, y_{n} x_{n-1}\right\}$.
Let $\mathrm{u}_{\mathrm{i}}, \mathrm{v}_{\mathrm{i}}$ and $s_{i}$ be the pendent vertices attached at zig-zag triangle $\mathrm{Z}\left(T_{n}\right)$.
Define a function $\mathrm{f}: \mathrm{V}(\mathrm{G}) \rightarrow\{1,2, \ldots, q+1\}$ by

$$
f\left(x_{1}\right)=4
$$

$$
\begin{aligned}
& f\left(x_{1}\right)=6 \mathrm{i}-3 \quad \text { for } 3 \leq i \leq n \quad \text { if } \quad \mathrm{i} \text { is odd } \\
& f\left(x_{i}\right)=6 \mathrm{i}-3 \quad \text { for } 2 \leq i \leq n \quad \text { if } \quad i \text { is even. } \\
& f\left(y_{2}\right)=7 \\
& f\left(y_{i}\right)=6 \mathrm{i}-4 \quad \text { for } 4 \leq i \leq n \quad \text { if } \quad \mathrm{i} \text { is even. } \\
& f\left(y_{1}\right)=2 \\
& f\left(y_{i}\right)=6 \mathrm{i}-5 \quad \text { for } 3 \leq i \leq n \quad \text { if } \quad \mathrm{i} \text { is odd. } \\
& f\left(u_{1}\right)=5 \\
& f\left(u_{i}\right)=12 \mathrm{i}-10 \quad \text { for } 2 \leq i \leq\left\lceil\frac{n}{2}\right\rceil \\
& f\left(s_{1}\right)=6 \\
& f\left(s_{i}\right)=12 i-7 \quad \text { for } 2 \leq i \leq\left\lfloor\frac{n}{2}\right\rfloor \\
& f\left(v_{1}\right)=1 \\
& f\left(v_{i}\right)=12 \mathrm{i}-12 \quad \text { for } 2 \leq i \leq\left\lceil\frac{n}{2}\right\rceil \\
& f\left(t_{1}\right)=11 \\
& f\left(t_{i}\right)=12 \mathrm{i}-2 \quad \text { for } 2 \leq i \leq\left\lfloor\frac{n}{2}\right\rfloor
\end{aligned}
$$

Then the resulting edge labels are distinct.

$$
\begin{array}{llrl}
f\left(x_{1} x_{2}\right) & =6 & & \\
f\left(x_{i+1} x_{i+2}\right) & =6 \mathrm{i}+6 & & \text { for } 2 \leq i \leq n-1 \\
f\left(x_{i+1} x_{i+2}\right) & =6 \mathrm{i}+6 & & \text { if } \quad \mathrm{i} \text { is even } \\
f\left(x_{1} u_{1}\right) & =4 & & \\
f\left(x_{i} u_{i+1}^{2}\right) & =6 \mathrm{i}-3 & \text { for } 1 \leq i \leq n-1 & \text { if } \quad \mathrm{i} \text { is odd } \\
f\left(s_{\frac{i}{2}} y_{i}\right) & =6 \mathrm{i}-5 & \text { for } 2 \leq i \leq n-1 & \text { if } \quad \mathrm{i} \text { is even } \\
f\left(x_{i} y_{i+1}\right) & =6 \mathrm{i}-1 & \text { for } 1 \leq i \leq n-2 & \text { if } \quad \mathrm{i} \text { is odd } \\
f\left(y_{2} x_{3}\right) & =9 & \text { for } 4 \leq i \leq n & \text { if } \quad \mathrm{i} \text { is even . } \\
f\left(y_{i} x_{i+1}\right) & =6 \mathrm{i}-1 & \text { for } 2 \leq i \leq n-1 & \text { if } \quad \mathrm{i} \text { is even. } \\
f\left(y_{i} x_{i}\right) & =6 \mathrm{i}-4 & \text { for } 1 \leq i \leq n & \text { if } \mathrm{i} \text { is odd. } \\
f\left(x_{i} y_{i}\right) & =6 \mathrm{i}-4 & &
\end{array}
$$

Thus f provides a harmonic mean labeling of graph G. Hence G is a harmonic mean graph.

## Example:2.1.1

A harmonic mean labeling of zig -zag triangle $\mathrm{Z}\left(T_{11}\right) \odot K_{1}$ is given in fig 2.1.1

fig 2.1.1

## Theorem:2.2

The zig-zag triangle $\mathrm{Z}\left(T_{n}\right) \odot \overline{K_{2}}$ is a harmonic mean graph.

## Proof:

Let $\mathrm{x}_{1}, \mathrm{x}_{2}, \ldots, \mathrm{x}_{\mathrm{n}}$ be the vertices of the path $P_{n}$ and let $\mathrm{G}=\mathrm{Z}\left(T_{n}\right)$ be the zig-zag triangle graph.

Let $\mathrm{V}(\mathrm{G})=\left\{x_{i} \mathrm{y}_{\mathrm{i}} / 1 \leq i \leq n\right\}$ and
$\mathrm{E}(\mathrm{G})=\left\{y_{i} x_{i-1}, y_{i} x_{i+1} / 2 \leq i \leq n-1\right\} \cup\left\{y_{i} x_{i} / 1 \leq i \leq n\right\} \cup\left\{y_{1} x_{2}, y_{n} x_{n-1}\right\}$.

Let $\mathrm{u}_{\mathrm{i}}, \mathrm{v}_{\mathrm{i}}$ be the vertices of $\overline{K_{2}}$ which are joined to the vertex $x_{i}$ of the path $\mathrm{p}_{\mathrm{n}}$ if i is odd and let $\mathrm{p}_{\mathrm{i}}, \mathrm{q}_{\mathrm{i}}$ be the vertices of $\overline{K_{2}}$ which are joined to the vertex $x_{i}$ of the path $\mathrm{p}_{\mathrm{n}}$ if i is even.

Let $\mathrm{z}_{\mathrm{i}}, \mathrm{t}_{\mathrm{i}}$ be the vertices of $\overline{K_{2}}$ which are joined to the vertex $y_{i}$ of the triangleif i is even and let $\mathrm{r}_{\mathrm{i}}, s_{i}$ be the vertices of $\overline{K_{2}}$ which are joined to the vertex $y_{i}$ of the triangle if i is odd.

Define a function $\mathrm{f}: \mathrm{V}(\mathrm{G}) \rightarrow\{1,2, \ldots, q+1\}$ by

| $f\left(x_{1}\right)$ | $=5$ |  |  |

Thus $f$ provides a harmonic mean labeling of graph $G$. Hence $G$ is a harmonic mean graph.

Thus $f$ provides a harmonic mean labeling of graph $G$. Hence $G$ is a harmonic mean graph.

## Example:2.3.1

A harmonic mean labeling of zig -zag triangle $\mathrm{Z}\left(T_{11}\right) \odot K_{2}$ is given in fig 2.4.1

fig 2.3.1

## Conclusion:

We have presented a few new results on Harmonic mean labeling of certain classes of graphs like the zig-zag triangle $\mathrm{Z}\left(T_{n}\right) \odot K_{1}, \mathrm{Z}\left(T_{n}\right) \odot \overline{K_{2}}, \mathrm{Z}\left(T_{n}\right) \odot K_{2}$. Analogous work can be carried out for other families and in the context of different types of graph labeling technique.
