# On $\pi g^{*}$ b - Continuous Functions 

K. Geethapadmini ${ }^{1}$, C.Janaki ${ }^{2}$<br>${ }^{1,2}$ Department of Mathematics, L.R.G.Government Arts College for Women, Tirupur, Tamil Nadu, India

#### Abstract

The aim of this paper is to characterize $\pi g^{*} b$-closure and $\pi g^{*} b$-interior, $\pi g^{*} b$-continuous functions. Further the concept of almost $\pi g^{*} b$-continuous and their properties are discussed.

Key words: $\pi g^{*} b-c l(A), \pi g * b-i n t(A), \pi g^{*} b$-continuous and almost $\pi g * b$-continuous.

## I. Introduction

Levine [8] introduced the concept of generalized closed sets in topological spaces. Andrijevic[1] introduced the concept of generalized open sets called b-open sets. Since then many authors have contributed to the study of generalized b-closed sets. In 1968 Zaitsev [19] defined $\pi$-closed sets. Dontchev and Noiri [4] introduced the notion of $\pi \mathrm{g}$-closed sets. Veerakumar[17] introduced the notion of $\mathrm{g}^{*}$-closed sets. Sreeja and C.Janaki[13] introduced the concept of $\pi \mathrm{gb}$-closed sets and $\pi \mathrm{gb}$-continuity in topological spaces.

Hussain(1966) [6], M.K.Singal and A.R. Singal(1968) introduced the concept of almost continuity in topological spaces. Recently K.Geethapadmini and C.Janaki [5] introduced and studied the properties of $\pi \mathrm{g}^{*} \mathrm{~b}$ closed sets in topological spaces. The purpose of this paper is to study $\pi \mathrm{g}^{*} \mathrm{~b}$-closure, $\pi \mathrm{g} * \mathrm{~b}$-interior, $\pi \mathrm{g} * \mathrm{~b}$ continuous functions and almost $\pi \mathrm{g}^{*} \mathrm{~b}$-continuous functions and some of its basic properties.

## II. Preliminaries

Throughout this paper $(\mathrm{X}, \tau)$ and ( $\mathrm{Y}, \sigma$ ) represents topological spaces on which no separation axioms are discussed. ( $\mathrm{X}, \tau$ ) will be replaced by X if there is no chance of confusion.

Definition 2.1 : A subset A of a topological space X is said to be

1) a $\alpha$ - closed set $[10]$ if $\operatorname{cl}(\operatorname{int}(\mathrm{cl}(\mathrm{A}))) \subset \mathrm{A}$
2) a pre-closed set $[9]$ if $\operatorname{cl}(\operatorname{int}(\mathrm{A})) \subset \mathrm{A}$
3) a regular closed set[11] if $\mathrm{A}=\mathrm{cl}(\operatorname{int}(\mathrm{A}))$
4) b-closed set[1] if $\operatorname{int}(\operatorname{cl}(\mathrm{A})) \cap \operatorname{cl}(\operatorname{int}(\mathrm{A})) \subset \mathrm{A}$
5) $\pi$-open [19] set if $A$ is a finite union of regular open sets.

Definition 2.2 : A subset A of a space ( $\mathrm{X}, \tau$ ) is called

1) a generalized closed ( briefly g-closed) [8] if $\operatorname{cl}(A) \subset U$ whenever $A \subset U$ and $U$ is open.
2) a generalized * closed (briefly $\mathrm{g}^{*}$-closed) $[17]$ if $\operatorname{cl}(\mathrm{A}) \subset \mathrm{U}$ whenever $\mathrm{A} \subset \mathrm{U}$ and U is $g$ - open.
3) a generalized *b-closed ( briefly $\mathrm{g} * \mathrm{~b}$-closed)[18] if bcl(A) $\subset \mathrm{U}$ whenever $\mathrm{A} \subset \mathrm{U}$ and U is g-open.
4) $\pi g$ - closed $[4]$ if $\operatorname{cl}(A) \subset U$ whenever $A \subset U$ and $U \pi$ - open.
5) $\pi$ gp- closed[12] if $\operatorname{pcl}(A) \subset U$ whenever $A \subset U$ and $U \pi$ - open.
6) $\pi \mathrm{g} \alpha-\operatorname{closed}[14]$ if $\alpha \mathrm{cl}(\mathrm{A}) \subset \mathrm{U}$ whenever $\mathrm{A} \subset \mathrm{U}$ and $\mathrm{U} \pi$ - open.
7) $\pi g s-\operatorname{closed}[2]$ if $\operatorname{scl}(A) \subset U$ whenever $A \subset U$ and $U \pi$ - open.
8) $\pi g b$ - closed [13] if $\operatorname{bcl}(A) \subset U$ whenever $A \subset U$ and $U \pi$ - open.
9) $\pi g^{*} \mathrm{p}$ - closed[15] if $\operatorname{pcl}(\mathrm{A}) \subset \mathrm{U}$ whenever $\mathrm{A} \subset \mathrm{U}$ and $\mathrm{U} \pi \mathrm{g}$ - open.
10) $\pi g^{*} \mathrm{~s}$ - closed $[16]$ if $\operatorname{scl}(\mathrm{A}) \subset \mathrm{U}$ whenever $\mathrm{A} \subset \mathrm{U}$ and $\mathrm{U} \pi \mathrm{g}$ - open.
11) $\pi g^{*} \mathrm{~b}-\operatorname{closed}[5]$ if $\operatorname{bcl}(A) \subset U$ whenever $A \subset U$ and $U \pi g$ - open.

Definition 2.3 : A function $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$ is called continuous (resp. $\alpha$ - continuous, pre- continuous, bcontinuous, $\mathrm{g} * \mathrm{~b}$ - continuous, $\pi \mathrm{gb}$ - continuous, $\pi \mathrm{g} * \mathrm{p}$ - continuous, $\pi \mathrm{g}^{*} \mathrm{~s}$ - continuous, $\pi \mathrm{g} * \mathrm{~b}$ - continuous) if $\mathrm{f}^{1}(\mathrm{~V})$ is closed ( resp. $\alpha$-closed, pre-closed, b-closed, $\mathrm{g} * \mathrm{~b}$-closed, $\pi \mathrm{gb}$-closed, $\pi \mathrm{g} * \mathrm{p}$-closed, $\pi \mathrm{g}^{*} \mathrm{~s}$ - closed, $\pi \mathrm{g} * \mathrm{~b}$ closed) in ( $\mathrm{X}, \tau$ ) for every closed set V in ( $\mathrm{Y}, \sigma$ ).

Theorem 2.4:[5] Every closed, $\alpha$-closed, pre-closed, b-closed, $\pi \mathrm{g}^{*} \mathrm{p}$ - closed, $\pi \mathrm{g} * \mathrm{~s}$ - closed sets are $\pi g^{*}$ b- closed and the converse need not be true.

Theorem 2.5 :[5] Every $\pi g^{*}$ b- closed set is $\pi g b$ - closed and $g * b$-closed and the converse need not be true.
Definition 2.6: [5] A function $f:(X, \tau) \rightarrow(Y, \sigma)$ is called $\pi g^{*} b$-irresolute if $f^{1}(V)$ is $\pi g^{*} b$-closed in $X$ for every $\pi \mathrm{g}^{*} \mathrm{~b}$-closed set V of Y .

## III. $\pi \mathrm{g} * \mathrm{~b}$-Closure and Interior

Definition 3.1: For any set $A \square X$, the $\pi g^{*} b$-closure of $A$ is defined as the intersection of all $\pi g^{*} b$-closed sets containing A and is denoted by $\pi \mathrm{g}^{*} \mathrm{~b}-\mathrm{cl}(\mathrm{A})$.

We write $\pi \mathrm{g} * \mathrm{~b}-\mathrm{cl}(\mathrm{A})=\cap\{\mathrm{F}: \mathrm{A} \square \mathrm{F}$ is $\pi \mathrm{g} * \mathrm{~b}$-closed in X$\}$
Theorem 3.2: For any $x \in X, x \in \pi g^{*} b-c l(A)$ iff $V \cap A \neq \phi$ for every $\pi g * b$-open set $V$ containing $x$.
Proof : Let us assume that there exists a $\pi g^{*} b$-open set $V$ containing $x$ such that $V \cap A=\phi$. Since $A \square X-V$, $\pi \mathrm{g}^{*} \mathrm{~b}-\mathrm{cl}(\mathrm{A}) \square \mathrm{X}-\mathrm{V}$. This implies $\mathrm{x} \notin \pi \mathrm{g}^{*} \mathrm{~b}-\mathrm{cl}(\mathrm{A})$, which is a contradiction to the fact that $\mathrm{x} \in \pi \mathrm{g}^{*} \mathrm{~b}-\mathrm{cl}(\mathrm{A})$. Hence, $\mathrm{V} \cap \mathrm{A} \neq \phi$ for every $\pi \mathrm{g} * \mathrm{~b}$-open set V containing x .

On the other hand, let $x \notin \pi g^{*} b$-cl(A). Then there exists a $x \notin \pi g^{*} b$-closed subset F containing A such that $x \notin F$. Then $x \in X-F$ and $x-F$ is $\pi g^{*} b$-open. Also ( $\left.X-F\right) \cap A \neq \phi$ which is a contradiction. Hence the lemma.

Lemma 3.3: Let $A$ and $B$ be subsets of $(X, \tau)$ Then
(i) $\pi g^{*} \operatorname{b-cl}(\phi)=\phi, \quad \pi \mathrm{g} * \mathrm{~b}-\mathrm{cl}(\mathrm{X})=\mathrm{X}$
(ii) if $\mathrm{A} \square \mathrm{B}, \pi \mathrm{g}^{*} \mathrm{~b}-\mathrm{cl}(\mathrm{A}) \square \pi \mathrm{g}^{*} \mathrm{~b}-\mathrm{cl}(\mathrm{B})$
(iii) $\quad \mathrm{A} \square \pi \mathrm{g}^{*} \mathrm{~b}-\mathrm{cl}(\mathrm{A})$
(iv) $\pi \mathrm{g}^{*} \mathrm{~b}-\mathrm{cl}(\mathrm{A}) \square \pi \mathrm{g} * \mathrm{~b}-\mathrm{cl}(\pi \mathrm{g} * \mathrm{~b}-\mathrm{cl}(\mathrm{A}))$

Proof: Straight forward
Theorem 3.4: If $A \square X$, is $\pi g^{*} b-c l o s e d$, then $\pi g^{*} b-c l(A)=A$.
Proof : Follows from the definition.
Remark 3.5 : The converse of the above theorem need not be true as seen by the following example.
Example 3.6: Let $\mathrm{X}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}\} . \tau=\{\phi,\{\mathrm{a}\},\{\mathrm{c}\},\{\mathrm{a}, \mathrm{c}\},\{\mathrm{c}, \mathrm{d}\},\{\mathrm{a}, \mathrm{c}, \mathrm{d}\}, \mathrm{X}\}$. Here $\mathrm{A}=\{\mathrm{c}\} . \pi \mathrm{g}^{*} \mathrm{~b}-\mathrm{cl}(\mathrm{A})=\mathrm{A}$ but A is not $\pi \mathrm{g}^{*} \mathrm{~b}$-closed.

Definition 3.7: For any set $A \square X$, the $\pi g^{*} b$-interior of $A$ is defined as the union of all $\pi g^{*} b$-open sets contained in A and is denoted by $\pi g^{*} \mathrm{~b}-\operatorname{int}(\mathrm{A})$.

We write $\pi \mathrm{g}^{*} \mathrm{~b}-\operatorname{int}(\mathrm{A})=\cup\left\{\mathrm{G}: \mathrm{G}\right.$ is $\pi \mathrm{g}^{*} \mathrm{~b}$-open and $\left.\mathrm{G} \square \mathrm{A}\right\}$.
Theorem 3.8 : Let A and B be subsets of X. Then
(i) $\pi g^{*} b-\operatorname{int}(\phi)=\phi, \quad \pi g^{*} b-\operatorname{int}(X)=X$
(ii) $\pi \mathrm{g}^{*} \mathrm{~b}-\operatorname{int}(\mathrm{A}) \square \mathrm{A}$
(iii) If B is any $\pi g^{*} b$-open set contained in A, then $B \square \pi g^{*} b-\operatorname{int}(A)$
(iv) If $\mathrm{A} \square \mathrm{B}, \pi \mathrm{g}^{*} \mathrm{~b}-\operatorname{int}(\mathrm{A}) \square \pi \mathrm{g}^{*} \mathrm{~b}-\operatorname{int}(\mathrm{B})$
(v) $\pi \mathrm{g}^{*} \mathrm{~b}-\operatorname{int}(\pi \mathrm{g} * \mathrm{~b}-\operatorname{int}(\mathrm{A}))=\pi \mathrm{g}^{*} \mathrm{~b}-\operatorname{int}(\mathrm{A})$.

Proof: Straight forward
Theorem 3.9: If $\mathrm{A} \square \mathrm{X}$ is $\pi \mathrm{g}^{*} \mathrm{~b}$-open, then $\pi g^{*} \mathrm{~b}-\operatorname{int}(\mathrm{A})=\mathrm{A}$.
Proof : Straight forward
Remark 3.10 : The converse of the above theorem need not be true as seen by the following example.
Example 3.11: Let $X=\{a, b, c, d\} . \tau=\{\phi,\{a\},\{c\},\{a, c\},\{c, d\},\{a, c, d\}, X\}$. Here $A=\{a, b, d\} . \pi g^{*} b-$ $\operatorname{int}(A)=A$ but $A$ is not $\pi g^{*}$ b-open.

## IV. $\boldsymbol{\pi g}$ *b- Continuous Functions

Theorem 4.1 : Every continuous function is $\pi \mathrm{g}^{*} \mathrm{~b}$-continuous.
Proof : Let $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$ be a continuous function. Let V be a closed set in Y. Since f is a continuous function, $f^{-1}(V)$ is closed in $X$. As every closed set is $\pi g^{*} b-c l o s e d, f^{-1}(V)$ is $\pi g^{*} b-c l o s e d$. Hence, f is $\pi \mathrm{g}^{*} \mathrm{~b}$-continuous.

## Theorem 4.2 :

(i) Every $\alpha$-continuous function is $\pi g^{*} b$-continuous.
(ii) Every b-continuous function is $\pi g^{*} b$-continuous.
(iii) Every pre-continuous function is $\pi g^{*} \mathrm{~b}$-continuous.
(iv) Every is $\pi g^{*} \mathrm{p}$-continuous function is $\pi g^{*} b$-continuous.
(iii) Every is $\pi g^{*} \mathrm{~s}$-continuous function is $\pi g^{*} \mathrm{~b}$-continuous.
(iv) Every is $\pi \mathrm{g}^{*} \mathrm{~b}$-continuous function is $\pi \mathrm{gb}$-continuous.
(vii) Every is $\pi g^{*} \mathrm{~b}$-continuous function is $\mathrm{g}^{*} \mathrm{~b}$-continuous.

Proof : Straight forward
Remark 4.3 : The converse of the above theorem need not be true as seen by the following examples.
Example 4.4: Let $\mathrm{X}=\mathrm{Y}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}\} . \tau=\{\phi,\{\mathrm{a}\},\{\mathrm{c}\},\{\mathrm{a}, \mathrm{c}\},\{\mathrm{c}, \mathrm{d}\},\{\mathrm{a}, \mathrm{c}, \mathrm{d}\}, \mathrm{X}\}$ and $\sigma=\{\phi,\{\mathrm{c}\},\{\mathrm{a}, \mathrm{b}\}$, $\{\mathrm{c}, \mathrm{d}\},\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}, \mathrm{X}\}$. Define $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$ by $\mathrm{f}(\mathrm{a})=\mathrm{c}, \mathrm{f}(\mathrm{b})=\mathrm{d}, \mathrm{f}(\mathrm{c})=\mathrm{a}, \mathrm{f}(\mathrm{d})=\mathrm{b}$. Here f is $\pi \mathrm{g}^{*} \mathrm{~b}-$ continuous but not continuous, $\alpha$-continuous, pre-continuous and $\pi \mathrm{g} * \mathrm{p}$-continuous.

Example 4.5: Let $\mathrm{X}=\mathrm{Y}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\} . \tau=\{\phi,\{\mathrm{a}\},\{\mathrm{b}, \mathrm{c}\}, \mathrm{X}\}$ and $\sigma=\{\phi,\{\mathrm{a}\},\{\mathrm{b}\},\{\mathrm{a}, \mathrm{b}\},\{\mathrm{b}, \mathrm{c}\}, \mathrm{X}\}$. Define $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$ by $\mathrm{f}(\mathrm{a})=\mathrm{a}, \mathrm{f}(\mathrm{b})=\mathrm{b}, \mathrm{f}(\mathrm{c})=\mathrm{c}$. Here f is $\pi \mathrm{g}^{*} \mathrm{~b}-$ continuous but not $\pi \mathrm{g}^{*} \mathrm{~s}$-continuous.

Example 4.6: Let $\mathrm{X}=\mathrm{Y}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}, \tau=\{\phi,\{\mathrm{a}\},\{\mathrm{b}\},\{\mathrm{a}, \mathrm{b}\},\{\mathrm{b}, \mathrm{c}\}, \mathrm{X}\}$ and $\sigma=\{\phi,\{\mathrm{a}\},\{\mathrm{b}\},\{\mathrm{a}, \mathrm{b}\}, \mathrm{X}\}$. Define $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$ by $\mathrm{f}(\mathrm{a})=\mathrm{a}, \mathrm{f}(\mathrm{b})=\mathrm{c}, \mathrm{f}(\mathrm{c})=\mathrm{b}$. Here f is $\pi \mathrm{gb}$-continuous but not $\pi \mathrm{g}^{*} \mathrm{~b}$-continuous.

Example 4.7: Let $\mathrm{X}=\mathrm{Y}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}\} . \tau=\{\phi,\{\mathrm{a}\},\{\mathrm{c}\},\{\mathrm{a}, \mathrm{c}\},\{\mathrm{c}, \mathrm{d}\},\{\mathrm{ac}, \mathrm{d}\}, \mathrm{X}\}$ and $\sigma=\{\phi,\{\mathrm{a}\},\{\mathrm{b}\},\{\mathrm{a}$, $b\}, X\}$. Define $f:(X, \tau) \rightarrow(Y, \sigma)$ by $f(a)=b, f(b)=c, f(c)=d, f(d)=a . f$ is $\pi g^{*} b$-continuous but not $b-$ continuous.

Remark 4.8 : Let $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$ be a function. Then
(i) $\pi g * b$-continuous and $\pi g \alpha$-continuous
(ii) $\pi \mathrm{g} * \mathrm{~b}$-continuous and $\pi \mathrm{gp}$-continuous
(iii) $\pi \mathrm{g} * \mathrm{~b}$-continuous and $\pi \mathrm{gs}$-continuous
(iv) $\pi \mathrm{g}^{*} \mathrm{~b}$-continuous and g-continuous
(v) $\pi \mathrm{g}^{*} \mathrm{~b}$-continuous and $\mathrm{g} *$-continuous are independent concepts.

Example 4.9: Let $\mathrm{X}=\mathrm{Y}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}, \tau=\{\phi,\{\mathrm{a}\},\{\mathrm{b}\},\{\mathrm{a}, \mathrm{b}\},\{\mathrm{b}, \mathrm{c}\}, \mathrm{X}\}, \sigma=\{\phi,\{\mathrm{a}\},\{\mathrm{b}, \mathrm{c}\}, \mathrm{X}\}$. The function $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$ defined by $\mathrm{f}(\mathrm{a})=\mathrm{b}, \mathrm{f}(\mathrm{b})=\mathrm{c}, \mathrm{f}(\mathrm{c})=\mathrm{a}$ is $\pi \mathrm{g} \alpha$-continuous, $\pi \mathrm{gp}$-continuous, $\pi \mathrm{gs}-$ continuous but not $\pi \mathrm{g}^{*} \mathrm{~b}$-continuous.

Example 4.10 : Let $\mathrm{X}=\mathrm{Y}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}, \tau=\{\phi,\{\mathrm{a}\},\{\mathrm{b}\},\{\mathrm{a}, \mathrm{b}\}, \mathrm{X}\}, \sigma=\{\phi,\{\mathrm{a}\},\{\mathrm{b}\},\{\mathrm{a}, \mathrm{b}\},\{\mathrm{b}, \mathrm{c}\}, \mathrm{X}\}$. The function $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$ defined by $\mathrm{f}(\mathrm{a})=\mathrm{b}, \mathrm{f}(\mathrm{b})=\mathrm{a}, \mathrm{f}(\mathrm{c})=\mathrm{c}$ is $\pi \mathrm{g} * \mathrm{~b}$-continuous but not $\pi \mathrm{g} \alpha$ continuous, $\pi \mathrm{gp}$-continuous, $\pi \mathrm{gs}$-continuous, g -continuous, and $\mathrm{g}^{*}$-continuous.

Example 4.11: Let $X=Y=\{\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}\}, \tau=\{\phi,\{\mathrm{a}\},\{\mathrm{b}\},\{\mathrm{a}, \mathrm{b}\}, \mathrm{X}\}, \sigma=\{\phi,\{\mathrm{a}\},\{\mathrm{c}\},\{\mathrm{a}, \mathrm{c}\},\{\mathrm{c}, \mathrm{d}\},\{\mathrm{a}$, $c, d\}, X\}$. The function $f:(X, \tau) \rightarrow(Y, \sigma)$ defined by $f(a)=c, f(b)=d, f(c)=a, f(d)=b$ is $g$-continuous but not $\pi \mathrm{g}^{*} \mathrm{~b}$-continuous.

Example 4.12: Let $\mathrm{X}=\mathrm{Y}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}\}, \tau=\{\phi,\{\mathrm{c}\},\{\mathrm{a}, \mathrm{b}\},\{\mathrm{c}, \mathrm{d}\},\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}, \mathrm{X}\}$,
$\sigma=\{\phi,\{\mathrm{c}\},\{\mathrm{d}\},\{\mathrm{c}, \mathrm{d}\},\{\mathrm{a}, \mathrm{c}, \mathrm{d}\},\{\mathrm{b}, \mathrm{c}, \mathrm{d}\}, \mathrm{X}\}$. The identity function $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$ is $\mathrm{g}^{*}$-continuous but not $\pi \mathrm{g} * \mathrm{~b}$-continuous.

Example 4.13: Let $X=Y=\{a, b, c, d, e\}, \tau=\{\phi,\{a\},\{b\},\{c\},\{a, b\},\{a, c\},\{b, c\},\{a, b, c\},\{a, c, d\},\{a$, $\mathrm{b}, \mathrm{c}, \mathrm{d}\}, \mathrm{X}\}, \sigma=\{\phi,\{\mathrm{b}\},\{\mathrm{c}\},\{\mathrm{b}, \mathrm{c}\},\{\mathrm{a}, \mathrm{b}, \mathrm{c}\},\{\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}\},\{\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{e}\}, \mathrm{X}\}$. The function defined by $\mathrm{f}(\mathrm{a})=\mathrm{a}$, $\mathrm{f}(\mathrm{b})=\mathrm{b}, \mathrm{f}(\mathrm{c})=\mathrm{d}, \mathrm{f}(\mathrm{d})=\mathrm{c}, \mathrm{f}(\mathrm{e})=\mathrm{e}$ is $\mathrm{g}^{*} \mathrm{~b}$ continuous but not $\pi \mathrm{g}^{*} \mathrm{~b}$-continuous.

Fig. 1

## V. Almost $\boldsymbol{\pi} \mathbf{g} * \mathbf{b}$ - Continuous Functions

Definition 5.1 : A function $f:(X, \tau) \rightarrow(Y, \sigma)$ is called almost $\pi g^{*} b$-continuous if $f^{1}(V)$ is $\pi g^{*} b$-closed in $X$ for every regular closed set V of Y .

Theorem 5.2 : For a function $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$, the following statements are equivalent.
(i) f is almost $\pi \mathrm{g} * \mathrm{~b}$-continuous
(ii) $f^{-1}(V)$ is $\pi g^{*} b$-open in $X$ for every regular open set $V$ of $Y$
(iii) $\mathrm{f}^{1}\left(\operatorname{int}(\operatorname{cl}(\mathrm{~V}))\right.$ is $\pi g^{*} \mathrm{~b}$-open in X for every open set V of Y .
(iv) $\mathrm{f}^{-1}\left(\operatorname{cl}(\operatorname{int}(\mathrm{~V}))\right.$ is $\pi \mathrm{g}^{*} \mathrm{~b}$-closed in X for every closed set V of Y .

## Proof : (i) $\Rightarrow$ (ii)

Suppose $f$ is almost $\pi g^{*} b$-continuous. Let $V$ be a regular open subset of $Y$. Since $Y-V$ is regular closed and $f$ is almost $\pi g^{*} b$-continuous, $f^{1}(Y-V)=X-f^{1}(V)$ is $\pi g^{*} b$-closed in $X$. Hence $f^{1}(V) \pi g * b$-open in $X$.
(ii) $\Rightarrow$ (i)

Let $V$ be a regular closed subset of $Y$. Then $Y-V$ is regular open. By hypothesis, $f^{-1}(Y-V)=X-f^{-1}(V)$ is $\pi g^{*} b$-open in $X$. Therefore $f^{1}(V)$ is $\pi g^{*} b$-closed. Hence $f$ is almost $\pi g^{*} b$-continuous.
(ii) $\Rightarrow$ (iii)

Let V be an open subset of Y . Then int $(\mathrm{cl}(\mathrm{V}))$ is regular open in Y . By hypothesis, $\mathrm{f}^{1}(\operatorname{int}(\mathrm{cl}(\mathrm{V}))$ is $\pi \mathrm{g} * \mathrm{~b}$-open in X .
(iii) $\Rightarrow$ (ii)

Let $V$ be a regular open subset of $Y$. Since $V=\operatorname{int}(\operatorname{cl}(V))$ and every regular open set is open then $f^{-1}(V) \pi g^{*} b$ open in X .
(iii) $\Rightarrow$ (iv)

Let V be a closed subset of Y . Then $\mathrm{Y}-\mathrm{V}$ is open in Y .
By hypothesis, $\mathrm{f}^{1}\left(\operatorname{int}(\mathrm{cl}((\mathrm{Y}-\mathrm{V})))=\mathrm{f}^{1}(\mathrm{Y}-\operatorname{cl}(\operatorname{int}(\mathrm{V})))=\mathrm{X}-\mathrm{f}^{1}(\mathrm{cl}(\operatorname{int}(\mathrm{V})))\right.$ is $\pi \mathrm{g}^{*} \mathrm{~b}$-open in X . Hence, f ${ }^{1}(\operatorname{cl}(\operatorname{int}(\mathrm{~V})))$ is $\pi \mathrm{g}^{*} \mathrm{~b}$-closed in X .
(iv) $\Rightarrow$ (iii)

Let V be an open subset of Y . Then $\mathrm{Y}-\mathrm{V}$ is closed in Y.
By hypothesis, $\mathrm{f}^{1}(\mathrm{cl}(\operatorname{int}(\mathrm{Y}-\mathrm{V})))=\mathrm{f}^{1}(\mathrm{Y}-\operatorname{int}(\mathrm{cl}(\mathrm{V})))=\mathrm{X}-\mathrm{f}-1(\operatorname{int}(\mathrm{cl}(\mathrm{V})))$ is $\pi \mathrm{g}^{*} \mathrm{~b}-\operatorname{closed}$ in X .
Hence $f^{1}\left(\operatorname{int}(\operatorname{cl}(V))\right.$ is $\pi g^{*} b$-open in $X$.
Theorem 5.3: Every $\pi g^{*} b$-continuous function is almost $\pi g^{*} b-c o n t i n u o u s$.
Proof : Let $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$ be $\pi \mathrm{g}^{*} \mathrm{~b}$-continuous. Let V be a regular closed set in Y . Then V is closed in Y . since $f$ is $\pi g * b$-continuous $f-1(V)$ is $\pi g^{*} b$-closed in $X$. Hence $f$ is almost $\pi g * b$-continuous.

Remark 5.4: The converse of the above theorem need not be true as seen in the following example.
Example 5.5 : Let $\mathrm{X}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}, \tau=\{\phi,\{\mathrm{a}\},\{\mathrm{b}\},\{\mathrm{a}, \mathrm{b}\}\}, \mathrm{X}$,$\} and \sigma=\{\phi,\{\mathrm{a}\},\{\mathrm{b}\},\{\mathrm{a}, \mathrm{b}\},\{\mathrm{b}, \mathrm{c}, \mathrm{X}\}$. Define $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$ by $\mathrm{f}(\mathrm{a})=\mathrm{a}, \mathrm{f}(\mathrm{b})=\mathrm{c}, \mathrm{f}(\mathrm{c})=\mathrm{b}$. Here f is almost $\pi \mathrm{g}^{*} \mathrm{~b}$-continuous but not $\pi \mathrm{g}^{*} \mathrm{~b}$-continuous.

Theorem 5.6 : An R-map is almost $\pi g^{*} \mathrm{~b}$-continuous.
Proof : Let $f: X \rightarrow Y$ is an R-map and $V$ be a regular closed subset in Y. Therefore $f^{-1}(V)$ is a regular closed set in X. Since every regular closed set closed, $\quad f^{1}(V)$ is closed in $X$. Thus, $f^{1}(V)$ is $\pi g^{*} b$-closed in X. Hence $f$ is almost $\pi \mathrm{g}^{*} \mathrm{~b}$-continuous.

Remark 5.7 : The converse of the above theorem need not be true as seen in the following example.
Example: Let $\mathrm{X}=\mathrm{Y}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}\}, \tau=\{\phi,\{\mathrm{c}\},\{\mathrm{a}, \mathrm{b}\},\{\mathrm{c}, \mathrm{d}\},\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}, \mathrm{X}\}$ and $\sigma=\{\phi,\{\mathrm{a}\},\{\mathrm{d}\},\{\mathrm{a}, \mathrm{d}\}$, $\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}, \mathrm{X}\}$. The function $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$ defined by $\mathrm{f}(\mathrm{a})=\mathrm{a}, \mathrm{f}(\mathrm{b})=\mathrm{d}, \mathrm{f}(\mathrm{c})=\mathrm{a}, \mathrm{f}(\mathrm{d})=\mathrm{c}$ is almost $\pi \mathrm{g} * \mathrm{~b}-$ continuous but not an R-map.

Theorem5.8: If $f: X \rightarrow Y$ is almost b-continuous then $f$ is $f: X \rightarrow Y$ is almost $\pi g^{*} b$-continuous.
Proof : Let $\mathrm{f}: \mathrm{X} \rightarrow \mathrm{Y}$ be an almost b-continuous. Let V be a closed set in Y . Then $\mathrm{f}^{-1}(\mathrm{~V})$ is b-closed in X . since every b-closed set is $\pi g^{*} b$-closed, $f^{1}(V)$ is $\pi g^{*} b$-closed. Hence $f$ is almost $\pi g^{*}$ b-continuous.

Remark 5.9: The converse of the above theorem need not be true as seen in the following example
Example 5.10 : Let $X=Y=\{a, b . c\}, \tau=\{\phi,\{a\},\{b, c\}, X\}$ and $\sigma=\{\phi,\{a\},\{b\},\{a, b\},\{b, c\}, X\}$. The identity function $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow(\mathrm{Y}, \sigma)$ is almost $\pi \mathrm{g}^{*} \mathrm{~b}$-continuous but not b -continuous.

Theorem 5.11: Let $X$ be a $\pi g^{*} b-T_{1 / 2}$ space. Then $f: X \rightarrow Y$ is almost $\pi g^{*} b$-continuous iff $f$ is almost bcontinuous.

Proof : Suppose $f: X \rightarrow Y$ is almost $\pi g^{*} b$-continuous. Let $V$ be a regular closed subset in $Y$. Then $f^{-1}(V)$ is $\pi g^{*} b$-closed in X . since X is $\pi \mathrm{g}^{*} \mathrm{~b}-\mathrm{T}_{1 / 2}$ space, $\mathrm{f}^{-1}(\mathrm{~V})$ is b-closed in X .

Therefore $f$ is almost b-continuous.
Conversely, suppose that $f: X \rightarrow Y$ is almost b-continuous. Let $V$ be a regular closed subset in $Y$. Then $f^{1}(V)$ is b-closed in $X$. Since every b-closed set is $\pi g^{*} b$-closed, $f^{1}(V)$ is $\pi g^{*} b$-closed. Therefore $f$ is almost $\pi g^{*} b$ continuous.

Theorem 5.12 : Every $\pi g^{*}$ b-irresolute function is almost $\pi g^{*} \mathrm{~b}$-continuous.
Proof : Straight forward.
Remark 5.13 : The converse of the above theorem need not be true as seen in the following example
Example: 5.14 Let $\mathrm{X}=\{\mathrm{a}, \mathrm{b}, \mathrm{c}\}, \tau=\{\phi,\{\mathrm{a}\},\{\mathrm{b}\},\{\mathrm{a}, \mathrm{b}\},\{\mathrm{b}, \mathrm{c}\}, \mathrm{X}\}, \sigma=\{\phi,\{\mathrm{b}, \mathrm{c}\}, \mathrm{X}\}$. Define $\mathrm{f}:(\mathrm{X}, \tau) \rightarrow$ $(X, \sigma)$ by $f(a)=a, f(b)=c, f(c)=b$. Then $f$ is almost $\pi g^{*} b-$ continuous but not $\pi \mathrm{g}^{*} \mathrm{~b}$ irresolute.
